

C500 Programmable Controller

Installation Guide

Revised May 2000

Notice:

OMRON products are manufactured for use according to proper procedures by a qualified operator and only for the purposes described in this manual.

The following conventions are used to indicate and classify precautions in this manual. Always heed the information provided with them. Failure to heed precautions can result in injury to people or damage to the product.

DANGER

Indicates information that, if not heeded, is likely to result in loss of life or serious injury.

WARNING

Indicates information that, if not heeded, could possibly result in loss of life or serious injury.

Caution

Indicates information that, if not heeded, could result in relatively serious or minor injury, damage to the product, or faulty operation.

OMRON Product References

All OMRON products are capitalized in this manual. The word “Unit” is also capitalized when it refers to an OMRON product, regardless of whether or not it appears in the proper name of the product.

The abbreviation “Ch,” which appears in some displays and on some OMRON products, often means “word” and is abbreviated “Wd” in documentation in this sense.

The abbreviation “PC” means Programmable Controller and is not used as an abbreviation for anything else.

Visual Aids

The following headings appear in the left column of the manual to help you locate different types of information.

Note Indicates information of particular interest for efficient and convenient operation of the product.

1, 2, 3... 1. Indicates lists of one sort or another, such as procedures, checklists, etc.

About this Manual:

This manual describes the installation of the C500 Programmable Controller and includes the sections described below.

Please read this manual carefully and be sure you understand the information provided before attempting to install and operate the C500 Programmable Controller. **Be sure to read the following section before operating the C500 Programmable Controller.**

Section 1 is an introduction to Programmable Controllers. General information about what a Programmable Controller can do and how a Programmable Controller works is provided.

Section 2 provides a description of all the components of the C500. The names of all the individual parts of each Unit are given.

Section 3 explains how to assemble the C500. A detailed description of how to mount each Unit is provided.

Section 4 outlines the system connections involved in installing a C500 Programmable Controller Systems.

Section 5 contains the requirements for the installation environment of the C500. Suggestions for preventing electrical noise are included.

Section 6 explains the power considerations involved in installing the C500.

Section 7 lists safety considerations that should be kept in mind while installing the C500.

Appendixes, a **Glossary**, and an **Index** are also included.

WARNING Failure to read and understand the information provided in this manual may result in personal injury or death, damage to the product, or product failure. Please read each section in its entirety and be sure you understand the information provided in the section and related sections before attempting any of the procedures or operations given.

PRECAUTIONS

This section provides general precautions for using the Programmable Controller (PC) and related devices.

The information contained in this section is important for the safe and reliable application of the PC. You must read this section and understand the information contained before attempting to set up or operate a PC system.

- 1 Intended Audience
- 2 General Precautions
- 3 Safety Precautions
- 4 Operating Environment Precautions
- 5 Application Precautions

1 Intended Audience

This manual is intended for the following personnel, who must also have knowledge of electrical systems (an electrical engineer or the equivalent).

- Personnel in charge of installing FA systems.
- Personnel in charge of designing FA systems.
- Personnel in charge of managing FA systems and facilities.

2 General Precautions

The user must operate the product according to the performance specifications described in the operation manuals.

Before using the product under conditions which are not described in the manual or applying the product to nuclear control systems, railroad systems, aviation systems, vehicles, combustion systems, medical equipment, amusement machines, safety equipment, and other systems, machines, and equipment that may have a serious influence on lives and property if used improperly, consult your OMRON representative.

Make sure that the ratings and performance characteristics of the product are sufficient for the systems, machines, and equipment, and be sure to provide the systems, machines, and equipment with double safety mechanisms.

This manual provides information for programming and operating OMRON PCs. Be sure to read this manual before attempting to use the software and keep this manual close at hand for reference during operation.

 **WARNING** It is extremely important that a PC and all PC Units be used for the specified purpose and under the specified conditions, especially in applications that can directly or indirectly affect human life. You must consult with your OMRON representative before applying a PC System to the abovementioned applications.

3 Safety Precautions

 **WARNING** Do not attempt to take any Unit apart while the power is being supplied. Doing so may result in electric shock.

 **WARNING** Do not touch any of the terminals or terminal blocks while the power is being supplied. Doing so may result in electric shock.

 **WARNING** Do not attempt to disassemble, repair, or modify any Units. Any attempt to do so may result in malfunction, fire, or electric shock.

4 Operating Environment Precautions

-  **Caution** Do not operate the control system in the following locations:
- Locations subject to direct sunlight.
 - Locations subject to temperatures or humidity outside the range specified in the specifications.
 - Locations subject to condensation as the result of severe changes in temperature.
 - Locations subject to corrosive or flammable gases.
 - Locations subject to dust (especially iron dust) or salts.
 - Locations subject to exposure to water, oil, or chemicals.
 - Locations subject to shock or vibration.
-  **Caution** Take appropriate and sufficient countermeasures when installing systems in the following locations:
- Locations subject to static electricity or other forms of noise.
 - Locations subject to strong electromagnetic fields.
 - Locations subject to possible exposure to radioactivity.
 - Locations close to power supplies.
-  **Caution** The operating environment of the PC system can have a large effect on the longevity and reliability of the system. Improper operating environments can lead to malfunction, failure, and other unforeseeable problems with the PC system. Be sure that the operating environment is within the specified conditions at installation and remains within the specified conditions during the life of the system.

5 Application Precautions

Observe the following precautions when using the PC system.

-  **WARNING** Always heed these precautions. Failure to abide by the following precautions could lead to serious or possibly fatal injury.
- Always ground the system to 100 Ω or less when installing the Units. Not connecting to a ground of 100 Ω or less may result in electric shock.
 - Always turn OFF the power supply to the PC before attempting any of the following. Not turning OFF the power supply may result in malfunction or electric shock.
 - Mounting or dismounting I/O Units, CPU Units, Memory Units, or any other Units.
 - Assembling the Units.
 - Setting DIP switches or rotary switches.
 - Connecting cables or wiring the system.
 - Connecting or disconnecting the connectors.
-  **Caution** Failure to abide by the following precautions could lead to faulty operation of the PC or the system, or could damage the PC or PC Units. Always heed these precautions.
- Fail-safe measures must be taken by the customer to ensure safety in the event of incorrect, missing, or abnormal signals caused by broken signal lines, momentary power interruptions, or other causes.

- Interlock circuits, limit circuits, and similar safety measures in external circuits (i.e., not in the Programmable Controller) must be provided by the customer.
- Always use the power supply voltages specified in this manual. An incorrect voltage may result in malfunction or burning.
- Take appropriate measures to ensure that the specified power with the rated voltage and frequency is supplied. Be particularly careful in places where the power supply is unstable. An incorrect power supply may result in malfunction.
- Install external breakers and take other safety measures against short-circuiting in external wiring. Insufficient safety measures against short-circuiting may result in burning.
- Do not apply voltages to the Input Units in excess of the rated input voltage. Excess voltages may result in burning.
- Do not apply voltages or connect loads to the Output Units in excess of the maximum switching capacity. Excess voltage or loads may result in burning.
- Disconnect the functional ground terminal when performing withstand voltage tests. Not disconnecting the functional ground terminal may result in burning.
- Be sure that all the mounting screws, terminal screws, and cable connector screws are tightened to the torque specified in this manual. Incorrect tightening torque may result in malfunction.
- Leave the label attached to the Unit when wiring. Removing the label may result in malfunction if foreign matter enters the Unit.
- Remove the label after the completion of wiring to ensure proper heat dissipation. Leaving the label attached may result in malfunction.
- Double-check all wiring and switch settings before turning ON the power supply. Incorrect wiring may result in burning.
- Wire correctly. Incorrect wiring may result in burning.
- Mount Units only after checking terminal blocks and connectors completely.
- Be sure that the terminal blocks, Memory Units, expansion cables, and other items with locking devices are properly locked into place. Improper locking may result in malfunction.
- Check the user program for proper execution before actually running it on the Unit. Not checking the program may result in an unexpected operation.
- Confirm that no adverse effect will occur in the system before attempting any of the following. Not doing so may result in an unexpected operation.
 - Changing the operating mode of the PC.
 - Force-setting/force-resetting any bit in memory.
 - Changing the present value of any word or any set value in memory.
- Resume operation only after transferring to the new CPU Unit the contents of the DM Area, HR Area, and other data required for resuming operation. Not doing so may result in an unexpected operation.
- Do not pull on the cables or bend the cables beyond their natural limit. Doing either of these may break the cables.
- Do not place objects on top of the cables or other wiring lines. Doing so may break the cables.
- Use crimp terminals for wiring. Do not connect bare stranded wires directly to terminals. Connection of bare stranded wires may result in burning.
- When replacing parts, be sure to confirm that the rating of a new part is correct. Not doing so may result in malfunction or burning.
- Before touching a Unit, be sure to first touch a grounded metallic object in order to discharge any static built-up. Not doing so may result in malfunction or damage.

SECTION 1

Introduction

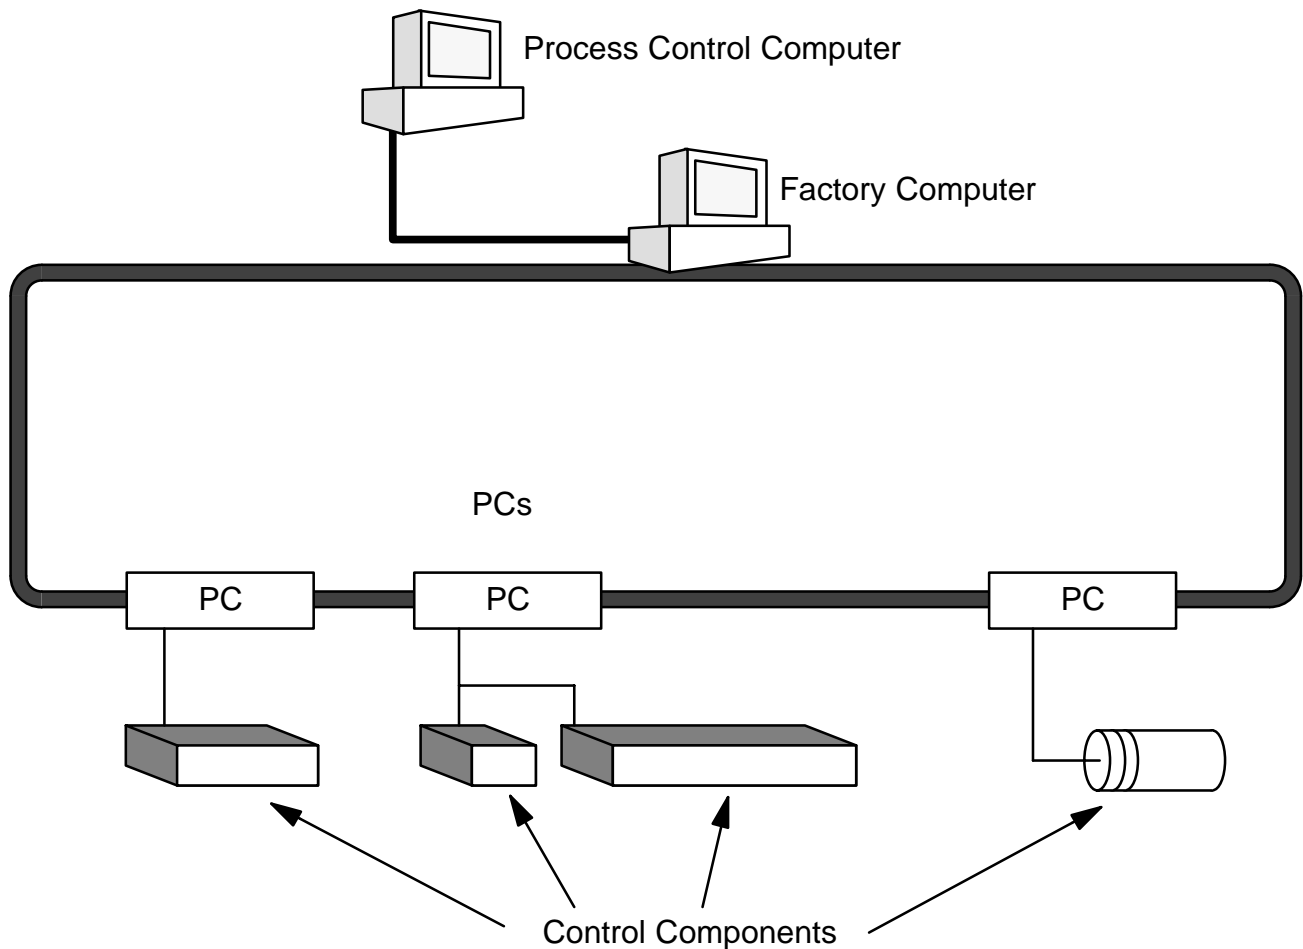

1-1	What is a Control System?
1-2	The Role of the PC
1-2-1	Input Devices
1-2-2	Output Devices
1-3	How Does a PC Work?

Introduction

This section provides general information about Programmable Controllers (Systems) and how they fit into a Control System.

1-1 What is a Control System?

A Control System is the electronic equipment needed to control a particular process. It may include everything from a process control computer, if one is used, to the factory computer, down through the PCs (and there may be many of them networked together), and then on down through the network to the control components: the switches, stepping motors, solenoids, and sensors which monitor and control the mechanical operations.

A Control System can involve very large applications where many different models of PC are networked together or it could be an application as small as a single PC controlling a single output device.

Position Control System

In the typical Control System example shown above, a PC controls the movement of the workpiece bed across two horizontal axes using Limit Switches and Servomotors to monitor and control movement.

1-2 The Role of the PC

The PC is the part of the Control System that directly controls the manufacturing process. According to the program stored in its memory, the PC accepts data from the input devices connected to it, and uses this data to monitor the controlled system. When the program calls for some action to take place, the PC sends data to the output devices connected to it to cause that action to take place. The PC may be used to control a simple, repetitive task, or it may be connected to other PCs, or to a host computer in order to integrate the control of a complex process.

1-2-1 Input Devices

PCs can receive input from either automated or manual devices. The PC could receive data from the user via a pushbutton switch, keyboard, or similar device. Automated input could come from a variety of devices: micro-switches, timers, encoders, photosensors, and so on. Some devices, like the Limit Switch shown below, turn ON or OFF when the equipment actually makes contact with them. Other devices, like the Photoelectric Switch and Proximity Switch shown below, use other means, such as light or inductance, in order to get information about the equipment being monitored.

Photoelectric Switch

Limit Switch

Proximity Switch

1-2-2 Output Devices

A PC can output to a myriad of devices for use in automated control. Almost anything that you can think of could be controlled (perhaps indirectly) by a PC. Some of the most common devices are motors, Solenoids, Servomotors, Stepping Motors, valves, switches, indicator lights, buzzers, and alarms. Some of these output devices, such as the motors, Solenoids, Servomotors, Stepping Motors, and valves, affect the controlled system directly. Others, such as the indicator lights, buzzers, and alarms, provide output to notify personnel.

Solenoid

Servomotor

Stepping Motor

1-3 How Does a PC Work?

PCs operate by monitoring input signals and providing output signals. When changes are detected in the signals, the PC reacts, through the user-programmed internal logic, to produce output signals. The PC continually cycles the program in its memory to achieve this control.

Block Diagram of PC

A program for your applications must be designed, and stored in the PC. This program is then executed as part of the cycle of internal operations of the PC.

Scanning Cycle

When a PC operates, that is, when it executes its program to control an external system, a series of operations are performed inside the PC. These internal operations can be broadly classified into the following four categories:

1. Common (or overseeing) processes, such as watchdog timer operation and testing the program memory.
2. Data input and output.
3. Instruction execution.
4. Peripheral device servicing.

Cycle Time

The total time required for a PC to perform all these internal operations is called the cycle time. The flowchart and diagram on page 7 illustrate these internal operations for a typical PC.

Timing is one of the most important factors in designing a Control System. For accurate operations, it is necessary to have answers to such questions as these:

- How long does it take for the PC to execute all the instructions in its memory?

- How long does it take for the PC to produce a control output in response to a given input signal?

The cycle time of the PC can be automatically calculated and monitored, but it is necessary to have an understanding of the timing relationships within the PC for effective System design and programming.

PC Operation Flowchart

SECTION 2

Description of All Components

2-1	CPU Rack
2-2	CPU Power Supply
2-3	Expansion I/O Backplane
2-4	I/O Power Supply
2-5	I/O Control Unit
2-6	I/O Interface Unit
2-7	I/O Units
2-8	Memory Packs

Introduction

This section provides information about the individual Units that make up the C500 PC. First the names of all the parts of the PC are given, followed by any details that apply to the Units that make up the PC. For a description of how the Units fit together to become a PC, refer to *3-3 System Configurations*. For information about the model numbers of any of the parts described in this section, refer to *Appendix C Standard Models*.

2-1 CPU Rack

The following figure shows the names of all the parts of the CPU Rack.

There are seven models of CPU Racks available for the C500 PC. Choose a Backplane with 3, 5 (2 models), 6, 8 (2 models), or 9 I/O slots, depending on your application. Connect the CPU Backplane to an Expansion I/O Rack via the Expansion I/O Connector.

CPU

The CPU executes the user program. The model available for the C500 PC does not have a built-in Power Supply or Memory Pack. Choose the Power Supply and memory pack suitable for your application. A peripheral device connector and a memory pack compartment are provided.

Peripheral Device Connector

The CPU is equipped with one connector for peripheral devices. A peripheral device, such as the CPU-Mounting Programming Console, can be mounted directly to the CPU and does not require a connecting cable. To mount the CPU-Mounting Programming Console or any other peripheral device directly to the CPU, follow these steps:

1. Detach the cover of the peripheral device connector with a standard screwdriver.
2. Connect the CPU-Mounting Programming Console to the peripheral device connector.
3. To ensure a positive connection, secure the Programming Console to the CPU by tightening the mounting screws located on the surface of the CPU.

2-2 CPU Power Supply

The CPU Power Supply is mounted to the rightmost slot of the CPU Rack. Three models of Power Supplies are available: 100 to 120 VAC, 200 to 240 VAC, and 24 VDC. The following table summarizes the output capacity of the three models and the current available for I/O Units mounted on the CPU Rack.

Model	Supply Voltage	Output Capacity	Available Current for I/O Units	24 VDC Output Terminal
3G2A5-PS221-E	100 to 120/ 200 to 240 VAC (selectable)	7 A 5 VDC	5 A	Provided
3G2A5-PS223-E		12 A 5 VDC	10 A	Not provided
3G2A5-PS213-E	24 VDC	9 A 5 VDC	5 A	Not provided

Note Be sure to keep the total power consumed by all the Units mounted on a Rack within the value stated in the table above. For example, do not mount I/O Units with a total current consumption of 6 A to a Rack supplied by a 7 A Power Supply. As shown in the table above, the available current for I/O Units is only 5 A. For details concerning current consumption, refer to *Section 4 System Connections*.

3G2A5-PS221-E

3G2A5-PS223-E

3G2A5-PS213-E

2-3 Expansion I/O Backplane

The Expansion I/O Backplane shown in the following diagram, can be used to expand the C500 PC. An Expansion I/O Rack is just like a CPU Rack, except a CPU is not mounted. However, a Power Supply is needed for each Expansion I/O Rack. There are three models of Expansion I/O Backplane available.

2-4 I/O Power Supply

Just as a Power Supply must be mounted to the CPU Rack, a Power Supply must also be mounted to each Expansion I/O Backplane. There are two Power Supplies available; 100 to 120/200 to 240 VAC and 24 VDC, both of which are explained below. For details, refer to *Appendix B Specifications*.

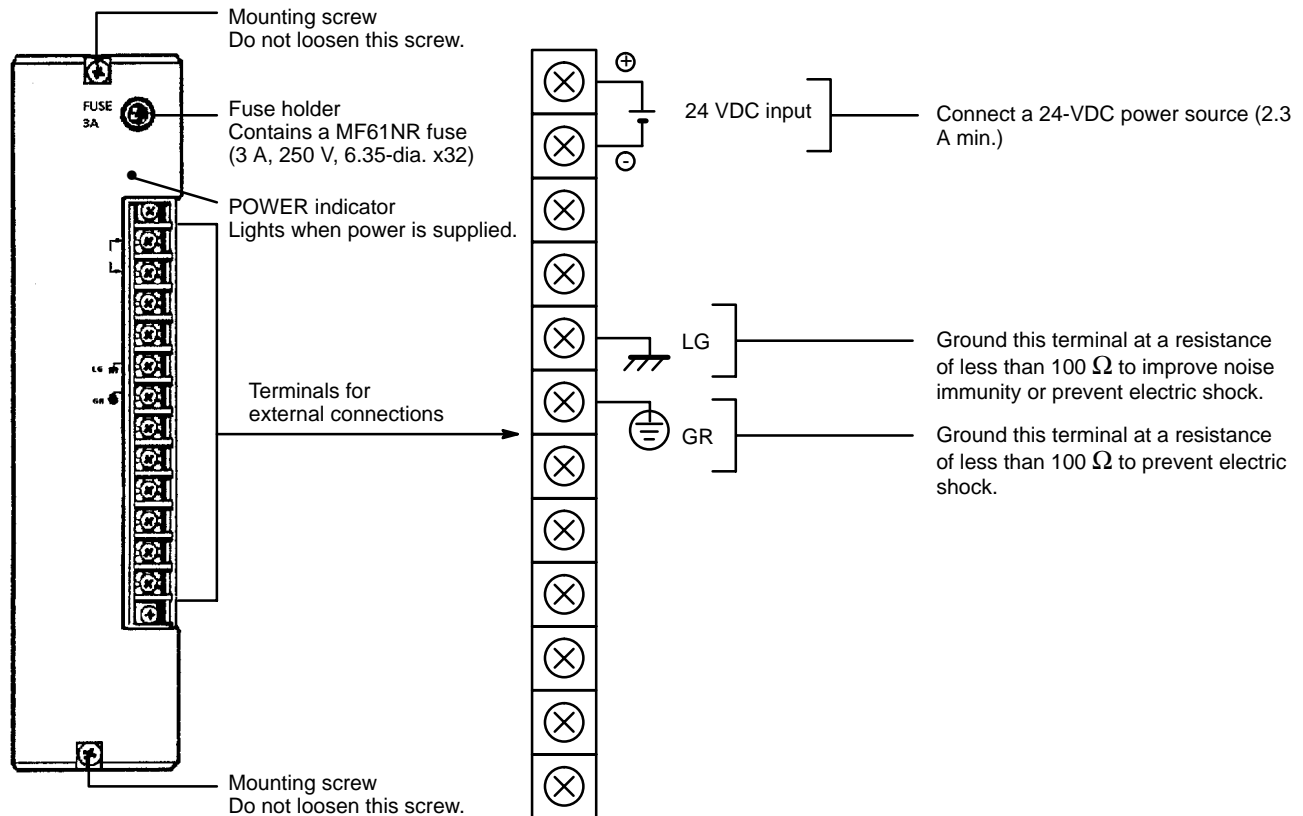

Model	Supply Voltage	Output Capacity	Available Current for I/O Units	240 VDC Output Terminal
3G2A5-PS222-E	100 to 120/200 to 240 VAC (selectable)	7A 5 VDC	6.5 A	Provided
3G2A5-PS212-E	24 VDC	7 A 5 VDC	6.5 A	Not provided

Note Be sure to keep the total power consumed by all the Units mounted on a Rack within the value stated in the table above. For example, do not mount I/O Units with a total current consumption of 7A to a Rack supplied by a 7 A Power Supply. As shown in the table above, the available current for I/O Units is only 6.5 A. For details concerning current consumption, refer to *Section 4 System Connections*.

3G2A5-PS222-E

3G2A5-PS212-E

2-5 I/O Control Unit

An I/O Control Unit must be mounted to the CPU Rack in order to connect the CPU Rack to an Expansion I/O Rack. An I/O Control Unit can be mounted even if no Expansion I/O Rack is used.

2-6 I/O Interface Unit

An I/O Interface Unit is needed on each Expansion I/O Rack, in order to expand the PC. If there is not an I/O Interface Unit on each Expansion I/O Rack, data communication cannot take place. The I/O Interface Unit is mounted to the leftmost I/O position on the Expansion I/O Backplane.

2-7 I/O Units

I/O Units come in 5 shapes; A-shape, B-shape, C-shape, D-shape, and E-shape. Refer to *Appendix B Specifications* for the dimensions of each Unit.

A-shape

B-shape

C-shape

D-shape

E-shape

2-8 Memory Packs

The Memory Pack fits into the slot located on the left side of the CPU. Because the Memory Pack is not provided with the PC upon delivery, a Memory Pack must be selected and installed in the CPU. There are two Memory Packs available, either RAM or ROM, that can be used in the C500H PC.

RAM Pack

Data can be randomly written to and read from the RAM Pack, making it possible to enter your own program into the CPU. However, because this is not a fixed program, the memory of the RAM Pack is erased when power is not supplied to the CPU or when the RAM Pack is removed from the CPU.

 **Caution** Do not remove the battery in the CPU when the RAM Pack has been removed from the CPU.

Two models of RAM Packs are available, which vary in memory capacity: 16K, and 24K words. Refer to *Appendix C Standard Models* for model numbers.

Using a Programming Console, execute FUN (01) and a search operation to check the amount of memory available.

ROM Pack

Data contained in the ROM Pack is stored on EPROM chips and cannot be altered or erased during the CPU's operation. Write the user's program to the EPROM chips and mount the chips (3 max.) on the ROM chip. The entire pack is installed in the CPU. Once the data is written to the chip the data will not be lost when the power to the PC is OFF.

SECTION 3

Assembly

3-1	Mounting the Units
3-2	Memory Packs
3-3	System Configurations

Introduction

When we speak of a PC, we usually think of it as a single object. But actually even the simplest PCs are usually composed of several different devices. In fact a single PC can be physically spread throughout a building, but we still call it one PC.

In this section, we will start with a Backplane and use all the Units discussed in *Section 2 Description of All Components* to build a PC.

3-1 Mounting the Units

There is no single Unit that can be said to constitute a Rack PC. To build a Rack PC, we start with a Backplane. The Backplane for the C500 is shown below.

C500 Backplane

The Backplane is a simple device having two functions. The first is to provide physical support for the Units to be mounted to it. The second is to provide the connectors and electrical pathways necessary for connecting the Units mounted to it.

The first device we will add to the Backplane is a Power Supply. The Power Supply fits into the rightmost position on the Backplane and provides electricity at the voltages required by the other Units of the PC. It can also be used to power devices other than the PC if necessary.

Power Supply

The core of the PC is the CPU. The CPU contains the program consisting of the series of steps necessary for the control task. The CPU fits into the position directly to the left of the Power Supply.

CPU

Unlike the CPU of the Package-type PC, the CPU of the Rack PC has no I/O points built in. So, in order to complete this kind of PC we need to mount one or more I/O Units to the Backplane. Mount the I/O Units to the Backplane by pressing the I/O Unit firmly into position, making sure the connectors are properly mated. Secure the Unit by tightening the mounting screws located on the top and bottom of the Unit.

The figure below shows one I/O Unit mounted directly to the left slot of the CPU Rack.

I/O Units are where the control connections are made from the PC to all the various input devices and output devices. As you can see from the figure, there is still some space available on the right side of the Backplane. This space is for any additional I/O Units that may be required.

The figure above shows a total of eight I/O Units mounted to the Backplane. Backplanes are available in different lengths, and can hold a different number of I/O Units accordingly. Of course, not all I/O Units look exactly alike, but the ones in the figure show their typical appearance. This configuration of Backplane, Power Supply, CPU, and I/O Units is called a CPU Rack. This term refers to the Backplane and all the Units mounted to it. However, if we want to include more than eight I/O Units in our configuration we can add an addi-

tional Backplane. First, though, we have to mount an I/O Control Unit to the leftmost slot of the CPU Rack.

Now we can use a cable to connect the CPU Rack to another Backplane. This Backplane has a Power Supply and I/O Units mounted to it, but it has no CPU of its own. The additional Backplane must also have an I/O Interface Unit mounted to its leftmost position. This configuration of additional Backplane, Power Supply, I/O Units, and I/O Interface Unit is called an Expansion I/O Rack.

The CPU Rack and Expansion I/O Rack shown above are connected by a cable. Remember that this whole configuration is still referred to as one PC. It is possible to keep adding Expansion I/O Racks in this way until the maximum number of I/O points for the system is reached. Each Expansion I/O Rack needs an I/O Interface Unit.

3-2 Memory Packs

The CPU has a removable Memory Pack that stores the user program. Two Memory Packs are available, in either RAM or ROM. You can write your own program into the RAM Pack or you can copy a program that has already been written to an EPROM chip and mount it in the ROM Pack. The EPROM Chip must be mounted to the PROM Writer in order for the program to be written to it. Then the EPROM Chip must be mounted to the ROM Pack.

Mounting the EPROM Chip to the ROM Pack

Depending on the amount of memory required for your application, use 1, 2, or 3 chips. Refer to *Appendix B Specifications* for specifications of the EPROM chips.

Using the diagram and the table below as a reference, mount the EPROM chips to the correct IC sockets.

The table below summarizes the programming capacity.

Memory size	Jumper setting	IC Socket		
		CHIP 0	CHIP 1	CHIP 2
8K bytes	128	2764	—	—
16K bytes	64	2764	2764	—
24K bytes		2764	2764	2764
16K bytes	128	27128	—	—
24K bytes	64	27128	—	2764

How to Install the Memory Pack

Take the following steps to install the Memory Pack in the CPU.

1. Turn the power to the PC OFF.

Caution

Do not attempt to install the Memory Pack in the CPU while the power to the PC is ON. Doing so may cause data to be lost, or may damage the CPU or Memory Pack.

- Using a standard screwdriver, remove the Memory Pack compartment cover located on the front panel of the CPU. Push in the latch on the cover and slide the cover upward.

Use a standard screwdriver to remove the Memory Pack compartment cover.

- Insert the Memory Pack (component side facing left) into the Memory compartment. When the Unit is almost completely inserted into the CPU, there may be a slight resistance as the Memory Pack connector mates with the connector inside the CPU. Continue pushing on the Memory Pack until it is inserted completely into the CPU.

- Reattach the memory compartment cover.

How to Remove the Memory Pack

Follow the steps below to remove the Memory Pack from the CPU.

- Turn the power to the PC OFF.
- Using a standard screwdriver, remove the Memory Pack compartment cover located on the front panel of the CPU. Push in the latch on the cover and slide the cover upward.
- Pull the Memory Pack up and out.

Note Memory in the RAM Pack is erased when the Memory Pack is removed from the CPU and when the CPU Unit is removed from the Rack.

3-3 System Configurations

The following figure shows an assembled C500 CPU Rack and one Expansion I/O Rack. When three Expansion I/O Racks are connected to a CPU Rack, a maximum of 512 I/O points are available. (Include the Remote I/O Units)

Where I/O Units Can Be Mounted

The table below summarizes the Units that can be used in the systems described in this manual.

Special I/O Units	The number of Special I/O Units that can be used depends upon the number of points available and the number of points the Special I/O Unit requires.
Host Link Units	Up to one Host Link Units can be mounted. Only one Rack-Mounting Host Link Unit can be mounted to the CPU Rack. A CPU-Mounting Host Link Unit can also be mounted directly to the CPU. Host Link Units cannot be mounted to Expansion I/O Racks. However, these Units cannot be mounted when the SYSMAC Net Link Unit is mounted.
I/O Units	Standard I/O Units are available with 16, 32, or 64 points. Refer to <i>Section 2 Description of All Components</i> for details.
Memory Packs	RAM or ROM Packs are available. The ROM Pack requires a separately available EPROM chip.
Remote I/O Master Unit	Up to four Remote I/O Master Units can be mounted to both the I/O Rack and the Expansion I/O Racks. When the Remote I/O Unit is mounted to a Rack, a Rack number must be set so that the CPU can identify the Remote I/O Unit. Mount the Remote I/O Slave Unit to the leftmost position (the I/O Interface Unit position) on the Slave Rack. For details, refer to the C500 Operation Manual.

The following table summarizes specific Units that can and cannot be mounted in the CPU and Expansion Racks and the number that can be used in each PC. For more information about the Units, refer to the *C500 Operation Manual*.

Unit	CPU Rack	Expansion Rack
16-, 32-, 64-point I/O	YES	YES
Special I/O	YES	YES
I/O Link	YES	YES
PC Link	YES (2 max.)	NO
Host Link	YES (2 max.)*	NO
SYSMAC Net Link	YES (1 max.)	NO
Remote I/O Master	YES	YES
Remote I/O Slave	NO	YES

*One Rack-mounting Host Link Unit can be mounted to the CPU Rack and one CPU-mounting Host Link Unit can be mounted directly to the CPU Unit.

- Notes**
1. The Position Control Unit and the PID Unit each require two I/O slots on the CPU Rack and the Expansion I/O Racks
 2. The following Units can only be mounted to one of the three or five rightmost slots on the CPU Backplane, depending on which Backplane is used.
 PC Link
 Host Link
 SYSMAC Net Link
 3. When two or more PCs are linked by the PC Link Unit, a maximum of 32 PC Link Units can be used (linking 31 PCs), in any number of subsystems.
 4. SYSMAC Net Link and Host Link cannot be mounted simultaneously.

SECTION 4
System Connections

4-1 Current Consumption
4-2 I/O Connections

Introduction

In the preceding sections we have covered all the parts of a PC and how they should be assembled. This section provides detailed information on PC connections.

4-1 Current Consumption

The Power Supplies are limited in the total current they can supply to I/O Units. The following table shows the maximum currents allowed.

Power Supplies

Unit	Model	Output Capacity	Current Available for I/O Units
CPU Power Supply	3G2A5-PS221-E	7 A 5 VDC	5 A
	3G2A5-PS211-E		
	3G2A5-PS213-E	9 A 5 VDC	10 A
3G2A5-PS223-E	12 A 5 VDC		
I/O Power Supply	3G2A5-PS222-E	7 A 5 VDC	6.5 A
	3G2A5-PS212-E		

Note Do not exceed the maximum current ratings for each of the voltages supplied by any single Unit listed above. In addition, do not exceed the total maximum power output for any single Unit listed above. Refer to the tables on the following page for the current consumption of individual I/O Units.

Input Units

Unit	Model	Current Consumption (A)
DC Input	3G2A5-ID112	0.01
	3G2A5-ID114	0.34
	3G2A5-ID213	0.02
	3G2A5-ID215	0.16
	3G2A5-ID218	0.16
	3G2A5-ID218CN	0.2
	3G2A5-ID212	0.3
	3G2A5-ID219	0.34
AC Input	3G2A5-IA121	0.01
	3G2A5-IA222	0.012
	3G2A5-IA223	0.06
	3G2A5-IA122	0.06
TTL Input	3G2A5-ID501CN	0.2
AC/DC Input	3G2A5-IM211	0.01
	3G2A5-IM212	0.2

Output Units

Unit	Model	Current Consumption (A)
Contact Output	3G2A5-OC221	0.1
	3G2A5-OC223	0.1
	3G2A5-OC224	0.2
Transistor Output	3G2A5-OD411	0.16
	3G2A5-OD215	0.2
	3G2A5-OD412	0.23
	3G2A5-OD212	0.23
	3G2A5-OD211	0.3
	3G2A5-OD213	0.46
	3G2A5-OD217	0.16
	C500-OD218	0.23
	C500-OD219	0.16
	3G2A5-OD415CN	0.23
	Triac Output	3G2A5-OA121
3G2A5-OA222		0.3
3G2A5-OA223		0.45
C500-OA225		0.2
C500-OA226		0.45
TTL Output	C500-OD501CN	0.25
DC Input/Transistor Output Unit	3G2A5-MD211CN	0.26
Dummy I/O	3G2A5-DUM01	0.035

Special I/O Units

Unit	Model	Current Consumption (A)
A/D Converter Input	3G2A5-AD001 to- AD005	0.3 each
	3G2A5-AD006	0.75 each
	3G2A5-AD007	
	C500-AD101	0.88
	C500-AD501	1.2
D/A Converter Output	3G2A5-DA001 to -DA005	0.55 each
	C500-DA101	1.3
High-speed Counter	3G2A5-CT001	0.3
	3G2A5-CT012	0.55
	C500-CT041	1.0
Magnetic Card Reader	3G2A5-MGC01	1.0
PID	3G2A5-PID01-E	1.4
Position Control	3G2A5-NC103-E	Total 1.4
	3G2A5-TU001-E	
	3G2A5-NC111-EV1	Total 1.0
	3G2A5-TU001-E	
	3G2A5-NC221-E	Total 1.3
	3G2A5-TU001	
ASCII	C500-ASC04	0.5 each
ID Sensor	C500-IDS01-V2/IDS02-V1	0.4 each
	C500-IDS21/IDS22	
Ladder Program I/O	3G2A5-LDP01-V1	0.8
File Memory	C1000H-FMR11	0.35 each
	C1000H-FMR21	
Cam Positioner	C500-CP131	0.35

Link Units and Remote I/O Units

Unit	Model	Current Consumption (A)
I/O Link	3G2A5-LK010-(P)E	0.6
PC Link	C500-LK009-V1	0.9
Host Link	C500-LK103 (-P)	1.0 each
	C500-LK203	
Optical Remote I/O Master	3G2A5-RM001-(P)EV1	0.7
SYSMAC Net Link	C500-SNT31-V4	1.4
Wired Remote I/O Master	C500-RM201	0.3

4-2 I/O Connections

Connect the I/O Devices to the I/O Units using AWG (cross-sectional area: 0.3 mm^2) for 19-terminal terminal blocks and AWG 22 to lead wire (cross-sectional area: 0.3 to 0.75 mm^2) for 10-terminal terminal blocks. The terminals have screws with 3.5-mm diameter heads and self-raising pressure plates. Connect the lead wires to the terminals as shown. Always use solderless (crimp) terminals. Tighten the screws to a torque of $0.8 \text{ N} \cdot \text{m}$.

Use M3.5 self-rising screws for the terminal screws of the Power Supply Units.

Always attach crimp terminals to the ends of the lead wires before attaching them to the terminals. Never attach loose or twisted wires.

Tighten the screws on the terminal block to a torque of $0.8 \text{ N} \cdot \text{m}$. Use crimp terminals for M3.5 screws of the dimensions shown below.

Terminal Block

The terminal block of an I/O Unit can be removed by loosening the mounting screws. You do not have to remove the lead wires from the terminal block in order to remove it from an I/O Unit.

Note Putting I/O Lines and high-tension lines or power lines in the same duct or conduit may cause the I/O Lines to be affected by noise. This may cause a malfunction in the I/O Unit or may cause damage to the I/O Unit or I/O devices.

Terminal block mounting screws
Loosen the terminal block mounting screws to remove the terminal block from the I/O Unit. Make sure the mounting screws on the terminal block are tightened after wiring is complete, and the terminal block is re-mounted to the I/O Unit.

Note When a Triac Output Unit is used to drive a low-current load, the load may not turn completely OFF due to a leakage current. To compensate for the leakage current, connect a bleeder resistor in parallel with the load.

Wiring Examples

The following are examples of how to connect I/O devices to I/O Units. During wiring, work slowly and carefully. If an input device is connected to an Output Unit, damage may result. Check all I/O devices to make sure they meet the specifications (refer to *Appendix B Specifications*). Be sure to allow for leakage current and load inductance.

DC Input Units

When using the following configurations, the sensor and Input Unit should receive their power from the same supply.

NPN current output

NPN open-collector output

PNP current output

AC Input

Contact output

AC Switching

Note If a reed switch is used as the input contact of the AC Input Unit, the reed switch must have a permissible current capacity of 1 A minimum, otherwise contact weld may result due to inrush current.

Output Units

A fuse placed in the output circuit will protect the output element, circuit board, etc., in the event of a short circuit in the output circuit.

SECTION 5
Installation Environment

5-1 Cooling
5-2 Mounting Requirements
5-3 Duct Work
5-4 Preventing Noise

Introduction

This section details the necessary environment and conditions for installation of the PC. For specific instructions on mounting Units and wiring for I/O and power, refer to *Section 3-3 System Configurations* and *4-2 I/O Connections*.

 **Caution** Static electricity can cause damage to PC components. Your body can carry an electrostatic charge, especially when the humidity is low. Before touching the PC be sure to first touch a grounded metallic object, such as a water pipe, in order to discharge any static build-up.

5-1 Cooling

There are two points to consider in order to ensure that the PC does not overheat. The first is the clearance between the Racks, and the second is installation of a cooling fan.

Clearance Between Racks

The Racks need to have sufficient room between each other to allow for I/O wiring, and additional room to ensure that the I/O wiring does not hamper cooling. However, the Racks must be mounted so that the length of the connecting cable does not exceed **2 m**, and the total length of the Connecting Cables between all Racks does not exceed 12 m. For details about cable lengths, refer to *Appendix C Standard Models*. As a general rule, about 70 to 120 mm should be left between any two Racks.

Cooling Fan

A cooling fan is not always necessary, but may be needed in some installations. Try to avoid mounting the PC in a warm area, or over a source of heat. A cooling fan is needed if the ambient temperature may become higher than that specified (refer to *Appendix B Specifications*). If the PC is mounted in an enclosure install a cooling fan, as shown in the following diagram, to maintain the ambient temperature within specifications.

5-2 Mounting Requirements

The PC consists of from one to nine Racks. Each Rack must be mounted vertically, that is with the printing on the front panels oriented as it would normally read. The Racks should be mounted one above the other with the CPU Rack uppermost.

The PC may be directly mounted to any sturdy support meeting the environmental specifications (refer to *Appendix B Specifications*).

The duct work shown in the following diagram is not used for mounting the Racks. Although optional, the duct work can be used to house the wires from the I/O Units that run along the sides of the Racks, keeping the wires from becoming entangled with other machines. The figures illustrate the correct way to mount the Racks.

The following figure shows a side view of a mounted CPU and two Expansion I/O Racks. There should be a distance of 70 to 120 mm between the mounted Units.

5-3 Duct Work

If power cables carrying more than 10 A 400 V, or 20 A 220 V must be run alongside the I/O wiring (that is, parallel to it), leave at least 300 mm between the power cables and the I/O wiring as shown below.

If the I/O wiring and power cables must be placed in the same duct (for example, where they are connected to the equipment), shield them from each other using grounded metal plates.

5-4 Preventing Noise

In order to prevent noise from interfering with the operation of the PC, use AWG 14 twisted-pair cables (cross-sectional area: 2 mm² min.). Avoid mounting the PC close to high-power equipment, and make sure the point of installation is at least 200 mm away from power cables as shown below.

Whenever possible, use wiring conduit to hold the I/O wiring. Standard wiring conduit should be used, and it should be long enough to completely contain the I/O wiring and keep it separated from other cables.

SECTION 6

Power Considerations

Introduction

Use a commercially available 100 to 120 VAC, 200 to 240 VAC, or 24 VDC power source, according to the PC you are using (refer to *Appendix B Specifications*). Expansion I/O Racks, if used, must also be connected to the power source. If possible, use independent power sources for the PC, input devices, and output devices. All Racks of the PC may be connected to one power source.

Grounding

The Line Ground (LG) terminal is a noise-filtered neutral terminal that does not normally require grounding. If electrical noise is a problem, however, this terminal should be connected to the Ground (GR) terminal.

To avoid electrical shock, attach a grounded (earth ground) AWG 14 wire (cross-sectional area: 2 mm² min.) to the GR terminal. The resistance to ground must be less than 100 Ω. Do not use a wire longer than 20 m. Care must be taken, because ground resistance is affected by environmental conditions such as soil composition, water content, time of year, and the length of time since the wire was laid underground.

PC operation may be adversely affected if the ground wire is shared with other equipment, or if the ground wire is attached to the metal structure of a building. When using an Expansion I/O Rack, the Rack must also be grounded to the GR terminal. The same ground can be used for all connections.

Power Failure

A sequential circuit is built into the PC to handle power interruptions. This circuit prevents malfunctions due to momentary power loss or voltage drops. A timing diagram for the operation of this circuit is shown below.

The PC ignores all momentary power failures if the interruption lasts no longer than 10 ms. If the interruption lasts between 10 and 25 ms, the interruption may or may not be detected. If the supply voltage drops below 85% of the rated voltage for longer than 25 ms (less for the DC Power Supply), the PC will stop operating and the external outputs will be automatically turned OFF. Operation is resumed automatically when the voltage is restored to more than 85% of the rated value.

Wiring

The following diagrams show the proper way to connect the power source to the PC. The terminals marked "NC" are not connected internally.

AC Connections

3G2A5-PS221-E/223-E

Screw (4 mm head with self-raising pressure plate)

Breaker

1:1 isolation transformer

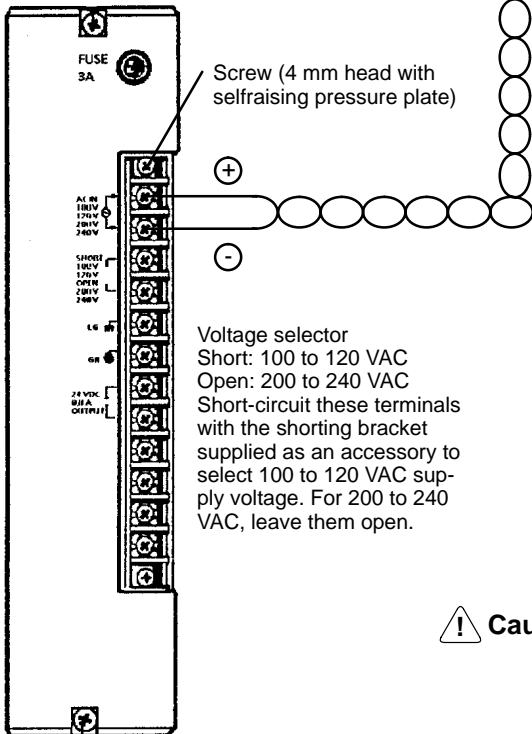

Voltage selector
 Short: 100 to 120 VAC
 Open: 200 to 240 VAC
 Short-circuit these terminals with the shorting bracket supplied as an accessory to select 100 to 120 VAC supply voltage. For 200 to 240 VAC leave them open.

Isolation transformer
 • Noise between the PC and ground can be significantly reduced by connecting a 1-to-1 isolation transformer. Do not ground the secondary coil of the transformer.

AC power source

- Supply 100 to 120 or 200 to 240 VAC
- Keep voltage fluctuations within the specified range (refer to *Appendix B Specifications*)

3G2A5-PS222-E

Screw (4 mm head with self-raising pressure plate)

Power line

- Use AWG 14 twisted-pair cable (cross-sectional area: 2 mm² min.)

Voltage selector
 Short: 100 to 120 VAC
 Open: 200 to 240 VAC
 Short-circuit these terminals with the shorting bracket supplied as an accessory to select 100 to 120 VAC supply voltage. For 200 to 240 VAC, leave them open.

Be sure to use a wire of at least 1.25 mm² in thickness. Use M4 screws for tightening crimp terminals. Use ring crimp terminals for wiring. Do not connect bare stranded wires directly to terminal blocks.

Caution

Tighten the screws on the terminal block of the AC Power Supply Unit to a torque of 1.2 N • m. Loose screws may result in burning or malfunction.

DC Connections

3G2A5-PS213-E

3G2A5-PS212-E

Grounding Connections

3G2A5-PS223-E/221-E/213-E

Be sure to use a wire of at least 1.25 mm² in thickness. Use M4 screws for tightening crimp terminals. Use crimp terminals for wiring. Do not connect bare stranded wires directly to terminal blocks.

Tighten the terminal block screws to a torque of 1.2 N • m.

Screw (4 mm head with self-raising pressure plate)

3G2A5-PS222-E/212-E

For grounding use 2mm² cable. Be sure to keep the length of the cable less than 20 meters.

Screw (4 mm head with self-raising pressure plate)

 **Caution** Ground the Power Supplies separately from peripheral devices.

SECTION 7
Safety Considerations

Introduction

There are certain safety requirements to be considered when installing the PC. Some of these, such as the emergency stop circuit (refer to *Power Supply*), are part of the initial wiring. The considerations described below should be kept in mind when operating the PC and when connecting I/O devices to the PC.

Interlock Circuits

When the PC controls an operation such as the clockwise and counterclockwise operation of a motor, provide an external interlock such as the one shown below to prevent both the forward and reverse outputs from turning ON at the same time.

This circuit prevents outputs MC1 and MC2 from both being ON at the same time. Even if the PC is programmed improperly or malfunctions, the motor is protected.

Power Supply Output

The 24 VDC output of the CPU and Expansion I/O Power Supply may be used to power other devices. The output current of these supplies is limited to 0.3 A. A separate Power Supply must be provided if the devices being powered require a higher current.

Input Leakage Current

When two-wire sensors, such as photoelectric sensors, proximity sensors or limit switches with LEDs are connected to the PC as input devices, the input bit may be turned ON erroneously by leakage current. In order to prevent this, connect a bleeder resistor across the input as shown below.

If the leakage current is less than 1.3 mA, there should be no problem. If the leakage current is greater than 1.3 mA, determine the value and rating for the bleeder resistor using the following formulas.

I = leakage current in mA

$$R = \frac{7.2}{2.4 \times I - 3} \text{ k}\Omega \text{ max.}$$

$$W = \frac{2.3}{R} \text{ W min.}$$

Output Leakage Current

If there is a possibility of leakage current causing a transistor or triac to malfunction, connect a bleeder resistor across the output as shown below.

Determine the value and rating for the bleeder resistor using the following formula.

$$R < \frac{E_{ON}}{I}$$

Where

E_{on} = ON voltage of the load

I = leakage current in mA

R = bleeder resistance

Output Surge Current

When connecting a transistor or triac Output Unit to an output device having a high surge current (such as an incandescent lamp), care must be taken to avoid damage to the Output Unit. The transistor and triac Output Units are capable of withstanding a surge current of ten times the rated current. If the surge current for a particular device exceeds this amount, use the circuit shown below to protect the Output Unit.

Another way of protecting the Output Unit lets the load draw a small current (about one third the rated current) while the output is OFF, significantly reducing the surge current. This circuit (shown below) not only reduces the surge current, but also reduces the voltage across the load at the same time.

Transistor Output Residual Voltage

When connecting TTL circuits to transistor Output Units, connect a pull-up resistor and a CMOS IC between the two. This is because of the residual voltage left on the transistor output after the output turns OFF.

Inductive Load Surge Suppressor

When an inductive load is connected to an I/O Unit, connect a surge suppressor or diode in parallel with the load as shown in the following diagram. This is so that the back electromagnetic field generated by the load will be absorbed.

- Resistor: 50 W
- Capacitor: 0.47 μ F
- Voltage: 200 V
- Diode: Must withstand voltages of more than three times the load voltage and an average current of 1 A

Electrical Noise

Take appropriate measures when any electrical device likely to produce noise is connected to the PC as a load. Devices generating noise of more than 1,200 V (such as electromagnetic relays and valves) require noise suppression. For noise sources running on AC power, connect a diode in parallel with the coil of each device.

When mounting a CPU Rack and an Expansion I/O Rack together on a mounting plate, provide a solid ground to the mounting plate. The mounting plate must be plated with a highly conductive surface in order to ensure noise immunity.

Appendices

A Inspection and Maintenance	
B Specifications	
C Standard Models	

A Inspection and Maintenance

Certain consumable items in a PC (such as fuses, relays, or batteries) need occasional replacement. This Appendix explains how to replace each of these items. Refer to *Appendix B Specifications* for the specifications of individual consumable items. Always keep spare items on hand so that they can be used as immediate replacements.

CPU and Power Supply Fuses

To replace a fuse in the CPU or Power Supply, follow the steps below.

1. Turn OFF the power to the PC.
2. Remove the fuse holder by turning it approximately 50° counterclockwise with a standard screwdriver.
3. Remove the fuse from the holder.

Turn counterclockwise to remove, clockwise to attach

Standard screwdriver

4. Insert a new fuse.
5. Reattach the fuse holder by turning it approximately 50° clockwise with a standard screwdriver.

Output Unit Fuses

To replace a fuse in an Output Unit, follow the steps below.

1. Turn OFF the power to the PC.
2. Detach the terminal block from the Output Unit, by removing the screws located at the top and bottom of the terminal block.

3. Remove the screws that mount the Output Unit to the Backplane. Pulling the Unit toward you, remove the Output Unit from the Backplane.
4. There are eight screws on each side of the Output Unit. Remove these screws to detach the case from the cover.
5. Pull out the printed circuit board.
6. Insert a new fuse.
7. Reassemble in reverse order.

Output Unit Relays

To replace a Relay in an Output Unit, follow the steps below.

1. Turn OFF the power to the PC.
2. Detach the terminal block from the Output Unit, by removing the screws located at the top and bottom of the terminal block.

3. Remove the screws that mount the Output Unit to the Backplane. Pulling the Unit toward you remove the Output Unit from the Backplane.
4. There are eight screws on each side of the Output Unit. Remove these screws to detach the case from the cover.
5. Pull out the printed circuit board. Place the Relays on the circuit board.
6. Use the Relay Puller to pull out the Relay. Insert a new Relay.
7. Reassemble in reverse order.

Batteries

When the battery is nearly discharged, the ALARM indicator blinks and the message "BATT LOW" appears on the Programming Console. When this occurs, replace the battery within one week to avoid loss of data. The battery comes with its own connector as a set. To replace the Battery Set follow the steps below. The entire replacement must be completed within five minutes to ensure that the data will not be lost.

1. Turn OFF the power to the PC. (If the power was not already ON, turn the power ON for at least one minute before turning the power OFF.)
2. Remove the cover from the battery compartment.
3. Remove the old Battery Set.
4. Install the new Battery Set as shown below.

5. Replace the cover of the battery compartment.
6. When a Programming Console is mounted to the CPU after the battery has been replaced, "BATT LOW" will be displayed. This message can be cleared by pressing CLR, FUN, MONTR, or just turning the power to the PC OFF and the ON again to clear the error message on the Programming Console.

Note The service life of the battery is four years at 25°C.

B Specifications

Power Supply Model	3G2A5-PS221-E/222-E/223-E	3G2A5-PS212-E/213-E
Supply Voltage	100 to 120/200 to 240 VAC (selectable) 50/60 Hz	24 VDC
Operating Voltage Range	85 to 132/170 to 264 VAC	20.4 to 26.4 VDC
Power Consumption	150 VA max.	55 W max.
Output Capacity	PS221: 7 A 5 VDC PS223: 120 A 5 VDC PS222: 7 A 5 VDC	PS213: 9 A 5 VDC PS212: 7 A 5 VDC
24 VDC Output*	0.8 A 24 VDC \pm 10%	Not provided
Insulation Resistance	5 M Ω min. (at 500 VDC) between AC terminals	
Dielectric Strength**	1,500 VAC 50/60 Hz for 1 minute (between AC and GR terminals) leakage current 10 m A max.	500 VAC 50/60 Hz for 1 minute (between DC and GR terminals) leakage current 1 mA max.
Noise Immunity	1,000 Vp-p, pulse width: 1 μ s, rise time: 1 ns	
Vibration Resistance	Mechanical durability: 10 to 25 Hz, 2 mm double amplitude, in X, Y, and Z directions, for 2 hours each Electrical durability: 16.7 Hz, 1 mm double amplitude, in X, Y, and Z directions, for 10 minutes each	
Shock	98 m/s ² in downward direction, 3 times	
Ambient Temperature	Operating: 0° to 55°C Storage: -20° to 65°C	
Humidity	35% to 85% RH (without condensation)	
Atmosphere	Must be free from corrosive gasses	
Grounding	Less than 100 Ω	
Structure	Panel-mounted	
Weight	8 kilograms max.	

*This output is not provided on Model PS223-E.

**When performing the dielectric strength test or the insulation resistance test be sure to disconnect the LG terminals from the GR (ground) terminals to protect the program and internal parts from damage.

CPU Specifications

Programming Method	Ladder diagram
Instruction Length	1 address/instruction, (1 to 4 words/instruction)
Number of Instructions	71 (12 basic instructions + 59 special instructions)

Weight	450 grams max.	
Circuit Configuration	 <p>The diagram shows two identical input circuit blocks, labeled I and II. Each block has a common terminal (COM) and eight input terminals (IN 00 to IN 07). A 2.2 kΩ resistor is connected between each input terminal and the common terminal. The internal circuitry includes a network of resistors and diodes leading to a relay or switch mechanism. The two blocks are connected to a common internal circuit.</p>	
Terminal Connections	 <p>The diagram shows a terminal block with 18 terminals. It is divided into two main sections, I and II. Section I has terminals 0-7 (inputs), 8 (COM), and 9-15 (inputs). Section II has terminals 0-7 (inputs), 8 (COM), and 9-15 (inputs). Terminals 16 and 17 are labeled COM, and terminal 18 is labeled NC. Two 24 VDC power sources are shown connected to the input terminals. The diagram also shows the internal wiring connecting the terminals to the input circuitry.</p>

**DC Input Unit
3G2A5-ID212**

In the case where a large number of bits must be controlled, an ID212 DC Input Unit can simplify wiring by controlling up to 64 bits through only 16 points. Using digital switches or a specially wired keyboard, different combinations of points can access specific bits and words. Two examples of connections using digital switches or a keyboard are given.

**Connection Example 1
(Keyboard)**

The table below shows how the ID212 DC Input Unit can be wired using a specially wired keyboard. For example, if A on the keyboard is pressed, the combination of DATA0 and STB 9 turn ON bit 00, word n. Similarly, the combination of DATA 7 and STB 7 turn ON bit 15, word n+3. The value of word n depends on where the Unit is mounted on the Rack. For details, refer to the C500 Operation Manual.

The table below shows the combinations made possible when the keyboard is wired as shown in the figure above.

Point Number	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
word n												E	D	C	B	A
word n + 1																
word n + 2																
word n + 3	Z	Y	X													

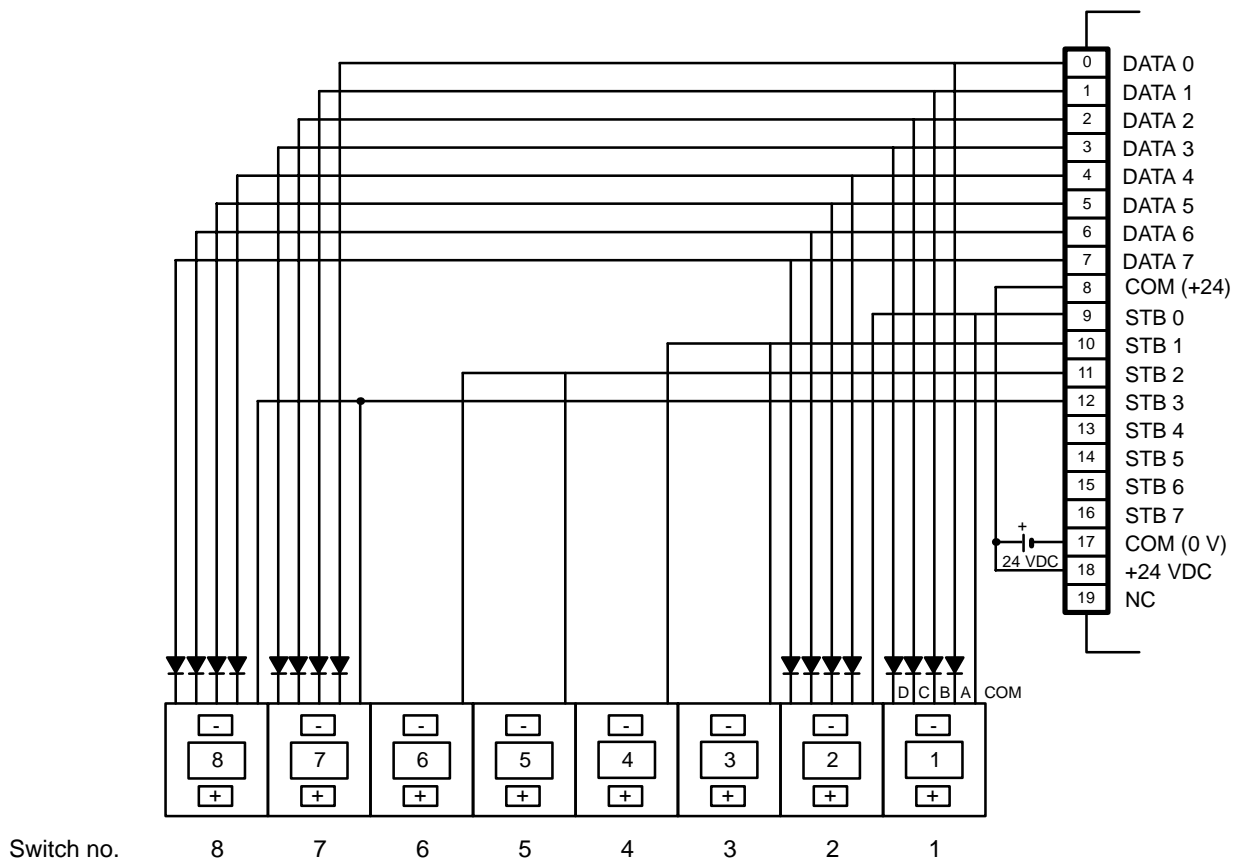

Note Because the DC Input Unit is operated on an extremely small current, make sure there is adequate distance between the DC Input Unit wires and high-tension equipment or power lines. If this cannot

be avoided, use shielded cables when wiring the DC Input Unit. Be sure to keep the total length of the wires less than 10 m.

Connection Example 2 (Digital Switches)

This example shows how the ID212 DC Input Unit can be wired using digital switches. Just as the keys on the keyboard can access different combinations of words and bits, the digital switches can access different combinations of words and bits. For example, the combination of switch no. 1 and point 00 access word bit 00, word n.

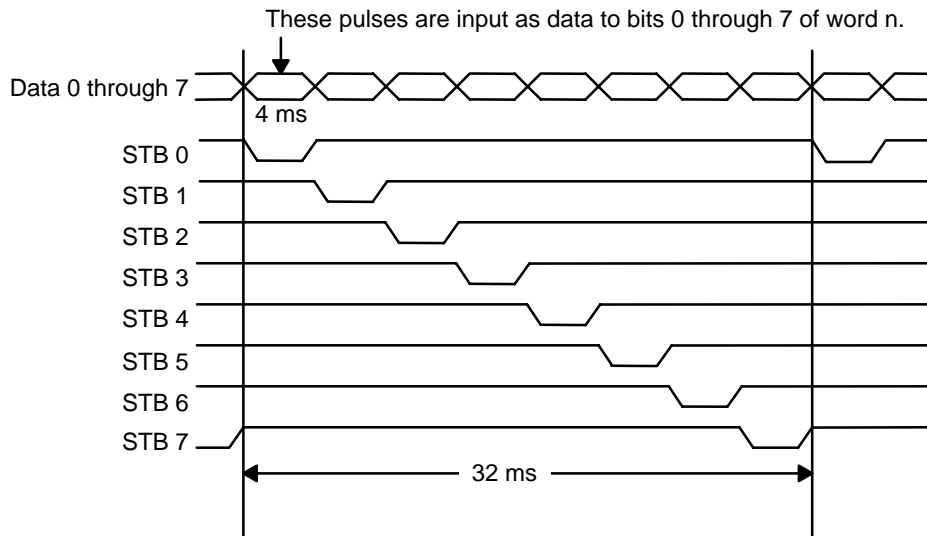

However, for the sake of simplicity the figure below shows the digital switches wired to control 32 bits instead of 64 bits as was shown in Example 1. Wire STB 4, STB 5, STB 6, and STB 7 to access an additional 32 bits.

The table below shows the combinations made possible when the digital switches are wired as shown in the figure above.

Point Number	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
word n	Switch no. 4				Switch no. 3				Switch no. 2				Switch no. 1			
	0	1	0	0	0	0	1	1	0	0	1	1	0	0	0	1
	STB 1								STB 0							
word n + 1	Switch no. 8				Switch no. 7				Switch no. 6				Switch no. 5			
word n + 1	1	0	0	0	0	1	1	1	0	1	1	0	0	1	0	1
	STB 3								STB 2							

Timing

**DC Output Unit
3G2A5-OD211**

By using the OD211 DC Output Unit, a large number of bits can be controlled through only 16 points. Just like the ID211 DC Input Unit, different combinations of points can access bits and words to control different outputs. Using this type of Unit can simplify wiring when many bits must be controlled. Up to 64 bits can be accessed.

Because the output data is positive logic, the terminal output goes high when the output data is logical 1. The strobe output is negative logic, so when a signal is output, the corresponding terminal goes low. Use positive logic output devices for the load of this Unit. The strobe output is cyclically and automatically output.

The table below shows the combinations made possible when the display is wired as shown in the figure on the preceding page. The value of word n depends on where the Unit is mounted on the Rack. For details, refer to the C500 Operation Manual.

Point Number	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
Data Number	07	06	05	04	03	02	01	00	07	06	05	04	03	02	01	00
word n	Display no. 4				Display no. 3				Display no. 2				Display no. 1			
	0	1	0	0	0	0	1	1	0	0	1	0	0	0	0	1
word n + 1	STB 1								STB 0							
	Display no. 8				Display no. 7				Display no. 6				Display no. 5			
	1	0	0	0	0	1	1	1	0	1	1	0	0	1	0	1
	STB 3								STB 2							

Note Because the DC Input Unit is operated on an extremely small current, make sure there is adequate distance between the DC Input Unit wires and high-tension equipment or power lines. If this cannot be avoided, use shielded cables when wiring the DC Input Unit. Be sure to keep the total length of the wires less than 10 m.

Timing

The following timing chart illustrates the operation of the Output Unit when wired as shown on the previous page.

TTL Input Units

**Special Considerations
for C500-OA225**

The maximum current value allowed per point differs depending on the ambient temperature and the number of points per common that are ON simultaneously. The graph below shows the relationship between the allowable current per point and the number of points ON per common. Be sure not to exceed the values depicted in the graph.

**Number of Points Per
Common Turned ON
Simultaneously**

The graph below shows the value of an surge current and the time it takes the current to level to a steady stream of current (current-carrying time). The curved line in the graph represents the maximum value of surge current at which the Unit can operate properly. It is suggested that when opening and closing a load with a large surge current, to keep the value of the surge current to half the value shown the graph (within the shaded area).

C500-BC091	2.8 kilograms
C500-BC061	2.2 kilograms
C500-BC031	1.8 kilograms

I/O Connecting Cables

Use an I/O Connecting Cable to connect the CPU Rack to an Expansion I/O Backplane or to connect an Expansion I/O Backplane to additional Expansion I/O Backplane.

Fasten the connectors with the locks provided on the connectors to secure the connection between the cable connector and the connector on the Backplane. If the connectors are not properly connected or the I/O Connecting Cable is disconnected during CPU operation, errors such as I/O BUS error and I/O SETTING error will occur.

The length of the connecting cable depends on the distance between the two Racks to be connected. The length of the cable should be approximately 20 cm longer than the distance between the two Racks.

Cable Length (L)	Distance between Rack (max.) (X)
30 cm	10 cm
50 cm	30 cm
80 cm	60 cm
1 m	80 cm
2 m	180 cm

The figures below show the dimensions of the cable and the height of the connector when the cable is connected to the Backplane.

Model	Cable Length (L)
C500-CN312N	30 cm
C500-CN512N	50 cm
C500-CN812N	80 cm
C500-CN122N	1 m
C500-CN222N	2 m

The length of an individual connecting cable can not be extended more than 2 m. Select each I/O cable and organize each device so the cable length is within 2 m.

Note Do not run the I/O connecting cable in the same duct with power lines or other I/O lines.

C Standard Models

CPU Backplane

Name	Remarks		Model
Backplane	9 I/O slots*	5 Link slots	C500-BC091
	8 I/O slots	3 Link slots	3G2A5-BC081

Peripheral Interface Unit	Connecting cable is separate.	3G2A5-IP006-E	
Graphic Programming Console	100 to 120 VAC, 32 K, w/comments	3G2A5-GPC03-E	
GPC Memory Pack	w/comments for C20, P-type, C120, C500	C500-MP303-EV2	
CRT Interface Unit	For connecting GPC to CRT	C500-GD101	
Cassette Recorder Connecting Cable	1 m	SCYPOR-PLG01	
SYSMAC Support Software (SSS)	Ladder diagram programming software for IBM PC/AT or compatible computer.	3.5" 2DD C500-ZL3AT1-E	

Optional Products

Name	Remarks	Model
Battery	–	3G2A9-BAT08
Relay	24 VDC	G6B-1174P-FD-US-M
I/O Terminal Cover	For 38-pin block, special type	3G2A5-COV11
	For 38-pin block, standard	C500-COV12
	For 20-pin block, standard	C500-COV13
Connector Cover	For I/O connector	3G2A5-COV01
	For Link connector	3G2A5-COV02
	For I/O Control Unit / I/O Interface Unit connector	3G2A5-COV03

Glossary

Backplane	A base to which Units are mounted to form a Rack. Backplanes provide a series of connectors for these Units along with wiring to connect them to the CPU and Power Supply. Backplanes also provide connectors used to connect them to other Backplanes. In some Systems, different Backplanes are used for different Racks; in other Systems, Racks differ only by the Units mounted to them.
back-up	A copy of existing data which is valuable if data is accidentally erased.
bit	The smallest piece of information that can be represented on a computer. A bit has the value of either zero or one, corresponding to the electrical signals ON and OFF. A bit is one binary digit.
central processing unit	A device that is capable of storing a program and data, and executing the set of instructions contained in the program. In a PC System, the central processing unit executes the program, processes I/O signals, communicates with external devices, etc.
communication cable	Cable used to transfer data between components of a control system and conforming to the RS-232C or RS-422 standards.
Control System	All of the hardware and software components used to control other devices. A Control System includes the PC System, the PC programs, and all I/O devices that are used to control or obtain feedback from the controlled system.
CPU	An acronym for central processing unit.
CPU Backplane	A Backplane used to create a CPU Rack.
CPU Rack	Part of a Rack PC, the CPU Rack contains the CPU, a Power Supply, and other Units.
data area	An area in the PC's memory that is designed to hold a specific type of data, e.g., the LR area is designed to hold common data in a PC Link System.
data link	Allows for the connection of up to 32 PCs in a Net Link System where each is contributing information to a common memory area. Data links may be established in the LR and/or DM memory areas.
distributed control	An automation concept in which control of each portion of an automated system is located near the devices actually being controlled, i.e., control is decentralized and "distributed" over the system. Distributed control is a concept basic to PC Systems.
EEPROM	[E(lectrically) E(rasable) P(rogrammable) R(ead) O(nly) M(emory)] A type of ROM in which stored data can be erased and reprogrammed. This is accomplished using a special control lead connected to the EEPROM chip and can be done without having to remove the EEPROM chip from the device in which it is mounted.
EPROM	[E(rasable) P(rogrammable) R(ead) O(nly) M(emory)] A type of ROM in which stored data can be erased, by ultraviolet light or other means, and reprogrammed.
Expansion I/O Unit	An I/O Unit for a Package-type PC that provides more I/O points to the PC.
factory computer	A general-purpose computer, usually quite similar to a business computer, that is used in automated factory control.
High-speed Counter	A Special I/O Unit. A High Speed Counter Unit counts independently of the PC's cycle time. This allows counting of very short, fast signals.

host computer	A computer that is used to transfer data to or receive data from a PC in a Host Link system. The host computer is used for data management and overall system control. Host computers are generally small personal or business computers.
IBM PC/XT or AT, or compatibles	A computer that has similar architecture to, and is logically compatible with an IBM PC/XT computer; and that can run software designed for that computer.
I/O Expansion Backplane	A Backplane used to create an Expansion I/O Rack.
I/O Control Unit	A Unit mounted to the CPU Rack in certain PCs to monitor and control I/O points on Expansion I/O Units.
I/O devices	The devices which are connected to the terminals on I/O Units, Special I/O Units, or Intelligent I/O Units. I/O devices may be part of the Control System if they function to help control other devices, or they may be part of the controlled system if they interact directly with it.
I/O Expansion Rack	Part of a Rack PC, an Expansion I/O Rack is connected to a CPU Rack to increase the number of slots available for mounting Units.
I/O Interface Unit	A Unit mounted to an Expansion I/O Rack in certain PCs to interface the Expansion I/O Rack to the CPU Rack. An I/O Interface Unit is needed when the first Expansion I/O Rack is connected to the CPU Rack via a Connecting Cable. Each Expansion I/O Rack needs an I/O Interface Unit.
I/O point	The place at which an input signal enters the PC System or an output signal leaves the PC System. In physical terms, an I/O point corresponds to terminals or connector pins on a Unit; in terms of programming, an I/O point corresponds to an I/O bit in the IR area.
I/O Unit	The most basic type of Unit mounted to a Backplane. I/O Units include Input Units and Output Units, each of which is available in a range of specifications. I/O Units do not include Special I/O Units, Link Units, etc.
PC	An acronym for Programmable Controller.
PC Link Unit	A Unit used to connect two or more PCs together so that they can exchange data through their LR areas.
Position Control Unit	A Special I/O Unit used to control the operation of positioning devices such as Servomotors.
Power Supply	A Unit that mounts to a Backplane in a Rack PC. It provides power at the voltage required by the other Units on the Rack.
Programmable Controller	A small, computer-like device that can control peripheral equipment, such as an electric door or quality control devices, based on programming and peripheral input devices. Any process that can be controlled using electrical signals can be controlled by a PC. PCs can be used independently or networked together into a system to control more complex operations.
PROM	[P(rogrammable) R(ead) O(nly) M(emory)] A type of ROM into which the program or data may be written after manufacture, by a customer, but which is fixed from that time on.
PROM Writer	A PROM Writer is a device used to write data to ROM, PROM, and EPROM storage chips.
Rack	An assembly that forms a functional unit in a Rack PC System. A Rack consists of a Backplane and the Units mounted to it. These Units include the Power Supply, CPU, and I/O Units. Racks include CPU Racks, Expansion I/O Racks, and I/O Racks. The CPU Rack is the Rack with the CPU mounted to it. An Expansion I/O Rack is an additional Rack that holds extra I/O Units. An I/O Rack is used in the C2000H Duplex System, because there is no room for any I/O Units on the CPU Rack in this System.

Rack PC	A PC that is composed of Units mounted to one or more Racks. This configuration is the most flexible, and most large PCs are Rack PCs. A Rack PC is the opposite of a Package-type PC, which has all of the basic I/O, storage, and control functions built into a single package.
RAM	[R(andom) A(ccess) M(emory)] RAM will not retain data when power is disconnected. Therefore data should not be stored in RAM.
Remote I/O Unit	A Unit that extends the distance an Expansion I/O Rack can be from the CPU.
ROM	[R(ead) O(nly) M(emory)] A type of digital storage that cannot be written to. A ROM chip is manufactured with its program or data already stored in it, and it can never be changed. However, the program or data can be read as many times as desired.
Special I/O Unit	A dedicated Unit that is designed for a specific purpose. Special I/O Units include Position Control Units, High-Speed Counters, Analog I/O Units, etc.
system configuration	The arrangement in which Units in a System are connected. This term refers to the conceptual arrangement and wiring together of all the devices needed to comprise the System. In OMRON terminology, system configuration is used to describe the arrangement and connection of the Units comprising a Control System that includes one or more PCs.
Unit	In OMRON PC terminology, the word Unit is capitalized to indicate any product sold for a PC System. though most of the names of these products end with the word Unit, not all do, e.g., a Remote Terminal is referred to in a collective sense as a Unit. Context generally makes any limitations of this word clear.

Revision History

A manual revision code appears as a suffix to the catalog number on the front cover of the manual.

Cat. No. W132-E1-4
 Revision code

The following table outlines the changes made to the manual during each revision. Page numbers refer to the previous version.

Revision code	Date	Revised content
1	June 1988	Original production
2	December 1988	Products added to pages 55, 58, 59, and 62.
3	July 1990	Complete revision based on format of W139-E1-2
3A	April 1991	<p>Page 33: Optical and Remote I/O Slave Units have been deleted in the Link Units and Remote I/O table.</p> <p>Page 82: In the table listing AC Input Unit Specifications, the internal current consumption for the 3G2A5-IA222 has been changed to 12 mA 5 VDC.</p> <p>Page 86: A table of fuse specifications has been added.</p> <p>Page 89: A table of Unit weights for the has been added.</p> <p>Pages 89 to 91: The section on I/O Connecting Cables has been completely rewritten.</p> <p>Page 92: Horizontal I/O Connecting Cable Models have been deleted in the Expansion I/O Backplane table.</p>
3B	October 1992	The CPU Power Supply Model number 3G2A5-PS211-E has been changed to 3G2A5-PS213-E throughout the manual.
3C	August 1996	<p>Scan time changed to cycle time throughout the manual. <i>Appendix C Standard Models</i> completely updated.</p> <p>Minor layout changes made.</p> <p>Page 16: OA223 removed and OD217 added to A-shape.</p> <p>Page 32: C500-IDS01-V1 and C500-IDS02 upgraded to C500-IDS01-V2 and</p> <p>C500-IDS02-V1 respectively. C500-IDS21/IDS22 added.</p> <p>Page 36: AC switching diagram corrected and note added.</p> <p>Page 74: Circuit configuration for 3G2A5-OD411 corrected.</p> <p>Page 77: Circuit configuration for C500-OD219 corrected.</p> <p>Page 80: 4.7 kΩ corrected to 10 kΩ in the circuit configuration and terminal connections.</p>
3D	February 1997	<p>Page xiii, xiv: Precautions added.</p> <p>Page 31, 94: Added C500-OA226, note added for OA121 and OA222 (p 94).</p> <p>Page 32: Added C500-AD501.</p> <p>Page 33, 46, 47: Changed/Added description for using crimp terminals.</p> <p>Page 45: Added caution.</p> <p>Page 55: Removed caution.</p> <p>Page 57: "Degree of Protection" revised to "Structure."</p> <p>Page 61: Resistance changed.</p> <p>Page 73: C500-OA226 added.</p> <p>Page 74, 77, 79: Fuse added.</p> <p>Page 75: Fuse added and resistances changed.</p> <p>Page 78: C500-OD212 added.</p> <p>Page 97: Name corrected to "SYSMAC BUS."</p>
4	May 2000	<p>Changes were made on the following pages.</p> <p>Pages xii to xiv: Major changes to safety information.</p> <p>Pages 30, 31, 64, 70, 72, 73, 77, 79, 80, 87, 91, 93, 95, 96: Changes made to model numbers.</p> <p>Pages 33, 45-47: Changes made to information on terminals.</p> <p>Page 45: Cautionary information changed.</p> <p>Page 57: "m/s²" used instead of "G."</p> <p>Page 73: "C-shape" changed to "A-shape."</p> <p>Pages 75, 76: Changes made to the circuit diagrams.</p> <p>Page 76: Information on wiring output circuits added.</p> <p>Page 87: Row added to table.</p>
