

## EVAL-AD5040EB/EVAL-AD506xEB

### FEATURES

**Full-featured evaluation board for the AD5040/AD506x**  
**Operates from single 2.7 V to 5.5 V supplies**  
**On-board reference**  
**Direct hookup to USB port of PC**  
**PC software for control of DAC**  
**Power-on reset to midscale or zero scale**  
**3 power-down functions**

### PACKAGE CONTENTS

**AD5040/AD506x evaluation board**  
**AD5040/AD506x device**  
**3 V reference (ADR423)**  
**CD including**

- Self-installing software that allows you to control the DAC and exercise all functions of the device**
- Electronic version of device data sheet**
- Electronic version of EVAL-AD5040EB/EVAL-AD506xEB data sheet**

**OP97 op amp (provided with EVAL-AD5063 only)**

### GENERAL DESCRIPTION

This data sheet describes the evaluation board for evaluating the AD5040, AD5060, AD5061, AD5062, and AD5063 *nano*DACs. These devices are low power, single 14-/16-bit buffered voltage-out DACs. Operating from single 2.7 V to 5.5 V supplies, the devices are well suited to battery-powered and other applications.

The AD5040/AD506x devices offer a relative accuracy specification of  $\pm 1$  LSB and operation is guaranteed monotonic with a  $\pm 1$  LSB DNL specification.

The AD5040 and AD506x devices use a versatile 3-wire serial interface that operates at clock rates up to 30 MHz and are compatible with standard SPI®, QSPI™, MICROWIRE™, and DSP interface standards. The reference for the AD5040 and AD506x devices is supplied from an external  $V_{REF}$  pin. A reference buffer is also provided on-chip. The AD5040/AD506x incorporate a power-on reset circuit that ensures the DAC output powers up to midscale or zero scale and remains there until a valid write occurs.

The AD5040 and the AD506x devices contain a power-down feature that reduces the current consumption of the device and provides software-selectable output loads while in power-down mode. The AD5061 is a low power, single 16-bit buffered voltage-out DAC. The AD5061 part offers a relative accuracy specification of  $\pm 4$  LSB, and operation is guaranteed monotonic with a  $\pm 1$  LSB DNL specification. The AD5063 is a low power, single 16-bit buffered voltage-out DAC and comes with on-board resistors in a 10-lead MSOP, allowing bipolar signals to be generated with an output amplifier. The AD5062 is a low power, single 16-bit unbuffered voltage-out DAC. The AD5062 offers a relative accuracy specification of  $\pm 1$  LSB, and operation is guaranteed monotonic with a  $\pm 1$  LSB DNL specification. An external reference can also be applied via an SMB input connector. The evaluation board is powered via terminal blocks.

## REVISION HISTORY

7/06—Revision 0: Initial Version

## EVALUATION BOARD HARDWARE

The evaluation board for the AD5040/AD506x requires a single positive supply (+2.7 V to +5.5 V). The evaluation board for the AD5063 requires a single negative supply, such as -5 V, for the external on-board op amp in order to generate a bipolar signal. A +5 V<sub>DD</sub> and -5 V<sub>SS</sub> supply are required to power the output amplifier in the AD5063, if the user requires a bipolar signal. The +5 V V<sub>DD</sub> is used to power the DAC. All supplies are decoupled to ground with 10 μF tantalum and 0.1 μF ceramic capacitors.

### EVALUATION BOARD LINK CONFIGURATON

The three link options (LK1, LK2, and LK3) must be set before using the evaluation board.

#### LK1

This sets the power to the Cypress USB microcontroller that controls the USB section of the chip. The supply for the microcontroller can be provided from an external supply or from the computer via the USB interface. Using the computer to set the supply, set Link 1 to Position A. To use an external supply, set the link to Position B.

#### LK2

Link 2 connects the on chip reference to the Reference pin on the DAC. If you are using the ADR423 to provide the reference to the DAC, then Link 2 must be set.

#### LK3

Link 3 is normally connected. This shows proper connection of the USB chip.

### SETUP CONDITIONS

Care should be taken before applying power and signals to the evaluation board to ensure that all link positions are as per the required operating mode. Table 1 shows the position in which all the links are set when the evaluation board is packaged.

**Table 1. Initial Link and Switch Positions**

Link No.	Initial Position	Function
LK1	Set to Position A	Power supplied from computer.
LK2	Closed	Reference supplied to Reference pin from ADR423.
LK3	Closed	USB cable connected.

### EVALUATION BOARD INTERFACING

The AD5040/AD5060/AD5061/AD5062 have 8 pins while the AD5063 has 10 pins as described in Table 2. Note that the last two entries in Table 2 (Pin INV and Pin R<sub>FB</sub>) apply only to the AD5063. Communication to the devices is accomplished via the Cypress CY7C63013 microcontroller Pin 45, Pin 46, and Pin 47.

**Table 2. AD5040/AD506x Pin Configuration**

Mnemonic	Function
V <sub>DD</sub>	Power supply input. Devices can operate from 2.7 V to 5.5 V and V <sub>DD</sub> , and should be decoupled to GND.
V <sub>REF</sub>	Reference voltage input.
DACGND	Ground input to the DAC.
V <sub>OUT</sub>	Analog output voltage from DAC.
SYNC	Level triggered control input (active low). This is the frame synchronization signal for the input data. When SYNC goes low, it enables the input shift register and data is transferred in on the falling edges of the following clocks. The DAC is updated following the 16 <sup>th</sup> clock cycle unless SYNC is taken high <u>before</u> this edge in which case the rising edge of SYNC acts as an interrupt and the write sequence is ignored by the DAC.
SCLK	Serial clock input. Data is clocked into the input shift register on the falling edge of the serial clock input. Data can be transferred at rates up to 30 MHz.
D <sub>IN</sub>	Serial data input. This device has a 16-/24-bit shift register. Data is clocked into the register on the falling edge of the serial clock input.
AGND	Ground reference point for analog circuitry on part.
INV <sup>1</sup>	Connected to the internal scaling resistors of the DAC. Connect the INV pin to the external op amp's inverting input in bipolar mode.
R <sub>FB1</sub> <sup>1</sup>	Feedback resistor. In bipolar mode, connect this pin to the external op amp circuit.

<sup>1</sup> For AD5063 only.

### SOCKETS

The J3 and J6 sockets are described in Table 3.

**Table 3. Socket Functions**

Socket	Function
J3	Subminiature BNC socket for the DAC output.
J6	Subminiature BNC socket for the reference output.

### CONNECTORS

The evaluation board connectors are described in Table 4.

**Table 4. Connector Function**

Connector	Functions
J1	USB connector.
J2	PCB-mounting terminal block. Supplies the digital power supply to the microcontroller.
J3, J6	PCB-mounting SMB connector. Provides connection to on-board reference output voltage.
J4, J7 <sup>1</sup>	PCB-mounting terminal block. Provides the reference power supply.
J5	PCB-mounting terminal block. Provides the power supply to the AD5040/AD506x.
J9 <sup>1</sup>	PCB-mounting terminal block. Provides connection to the DAC R <sub>FB</sub> pin.

<sup>1</sup> For AD5063 only.

## EVALUATION BOARD SOFTWARE

### INSTALLING THE SOFTWARE

The AD5040/AD506x evaluation kit includes self-installing software on CD-ROM. The software is compatible with Microsoft® Windows® 95 or higher.

Install the evaluation board software before connecting the evaluation board to the USB port of the PC. This ensures the evaluation board is correctly recognized when connected to the PC.

1. Start the Windows operating system and insert the CD-ROM.

The installation software launches automatically. If it does not, use Windows Explorer to locate the file **setup.exe** on the CD-ROM. Select this file to start the installation procedure.

2. At the prompt, select a destination directory, which is **C:\Program Files\Analog Devices\AD506X** by default.

Once the directory is selected, the installation procedure copies the files into the relevant directories on the hard drive. The installation program creates a program group called **Analog Devices** with subgroup **AD506X** in the **Start** menu of the taskbar.

### OPERATING THE SOFTWARE

1. Once the installation procedure is complete, select the **AD5040/60/61/62/63 icon** to start the program.
2. Choose the part to be tested as shown in Figure 2.

Figure 2. Device Selection

3. Select how the device should operate. Choose **Normal** to operate the device in normal mode. For power-down mode, choose one of the three available options (**Tri-State**, **100 kOhm to GND** or **1 kOhm to GND**) as shown in Figure 3.
4. Enter the DAC code in either decimal or hex code. Select the field populated with zeroes (**0000**) for decimal or **Hex** for hex. The AD5040 accepts a 16-bit command whereas AD506x accepts a 24-bit command.
5. Select **Update DAC** to update DAC output.

Figure 3. DAC Operation Selection

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.
