

LTC5583

DUAL 6GHz RMS POWER DETECTOR

DESCRIPTION

Demonstration circuit 1599A is a Mean-Squared Power Detector featuring the LTC®5583 IC. LTC5583 is a dual-channel RMS power detector, capable of measuring two AC signals. It provides 40dB of channel to channel isolation with no frequency separation at 2140MHz that is suited for measuring VSWR.

The LTC5583 is a wide dynamic range Mean Squared RF Power Detector, operational from 40MHz to 6GHz. The input dynamic range with ± 1 dB nonlinearity is 60dB depending on frequency (from -58 dBm to $+2$ dBm, single-ended 50 Ω input). The detector output voltage slope is normally 30mV/dB, and the typical output variation over temperature is ± 0.5 dB at 880MHz.

The DC1599A Demo Circuit is ideal for frequency operation below 3.0GHz. It has the single ended input drive to LTC5583. The input A to output B (or input B to output A) isolation is 33dB at 2.7GHz, and degrades as input frequency increases. As a result, operating above 3GHz may require differential input matching for improved isolation. Temperature performance is optimized for 2140MHz. Contact LTC applications for more information.

LTC is a trademark of Linear Technology Corporation. Design files for this circuit board are available. Call the LTC factory.

Typical Performance Summary ($V_{CC} = 3.3V$, EN = HIGH, $T_A = 25^\circ C$, unless otherwise noted. Test circuit shown in Figure 1.)

PARAMETER	CONDITION	VALUE
Supply Voltage		3.1V to 3.5V
Supply Current	Envelope detector off	80.5mA
	Envelope detector on	90.1mA
Shutdown Current	EN = Lo	0.1 μ A
EN Voltage	Low, Chip Disabled HIGH, Chip Enabled	0.3V max 2V min
EN Input Current	$V_{EN} = 0V$ $V_{EN} = 3.3V$	0 μ A 100 μ A
Output Start Voltage	No Input Signal Present	0.45V
Rise Time	0.5V to 2.2V, 10% to 90%, $C_{FLTRA}=C_{FLTRB} = 8.2nF$, $F_{RF} = 100$ MHz	140nS
Fall Time	2.2V to 0.5V, 90% to 10%, $C_{FLTRA}=C_{FLTRB} = 8.2nF$, $F_{RF} = 100$ MHz	3.5 μ S
Input Frequency Range	Operation over wider frequency range with reduced performance	40MHz to 6GHz
f = 450MHz		
Linear Dynamic Range	± 1 dB linearity error	63 dB
RF Input Power Range	CW, 50 Ω , ± 1 dB Linearity Error	-59 to 4 dBm
Slope		29.6mV/dB
Logarithmic Intercept		-78.5dBm

Deviation from CW Response	12 dB peak-to-average ratio (4 carrier WCDMA)	0.4
INA to VOB isolation	$P_{INB} = -45\text{dBm}$, $VOB = VOB$ $p_{INB} \pm 1\text{ dB}$, Frequency Separation=0Hz	50dB
INB to VOA isolation	$P_{INA} = -45\text{dBm}$, $VOA = VOA$ $p_{INA} \pm 1\text{ dB}$, Frequency Separation=0Hz	50dB
f =2140MHz		
Linear Dynamic Range	$\pm 1\text{ dB}$ linearity error	60 dB
RF Input Power Range	CW, 50Ω , $\pm 1\text{dB}$ Linearity Error	-58 to 2 dBm
Slope		29.6mV/dB
Logarithmic Intercept		-77.4dBm
Deviation from CW Response	12 dB peak-to-average ratio (4 carrier WCDMA)	0.3
INA to VOB isolation	$P_{INB} = -45\text{dBm}$, $VOB = VOB$ $p_{INB} \pm 1\text{ dB}$, Frequency Separation=0Hz	40dB
INB to VOA isolation	$P_{INA} = -45\text{dBm}$, $VOA = VOA$ $p_{INA} \pm 1\text{ dB}$, Frequency Separation=0Hz	40dB
f =2700MHz		
Linear Dynamic Range	$\pm 1\text{ dB}$ linearity error	59 dB
RF Input Power Range	CW, 50Ω , $\pm 1\text{dB}$ Linearity Error	-56 to 3 dBm
Slope		30mV/dB
Logarithmic Intercept		-74.9dBm
Deviation from CW Response	12 dB peak-to-average ratio (WiMAX OFDM)	0.6dB
INA to VOB isolation	$P_{INB} = -45\text{dBm}$, $VOB = VOB$ $p_{INB} \pm 1\text{ dB}$, Frequency Separation=0Hz	33dB
INB to VOA isolation	$P_{INA} = -45\text{dBm}$, $VOA = VOA$ $p_{INA} \pm 1\text{ dB}$, Frequency Separation=0Hz	33dB

Table 1. Jumper Description

JUMPER	FUNCTION	RANGE/SETTING (DEFAULT)
JP1	Chip Enable. EN for High, DIS for Lo	EN
JP2	VCCN. Power supply to the envelop detector for both channels. HI=on, LO=off	LO
JP3	INV. Swap control for the polarity of VODF. HI=(VOB-VOA)+VOS, LO=(VOA-VOB)+VOS	LO

QUICK START PROCEDURE

Demonstration circuit 1599A is easy to set up to evaluate the performance of the LTC5583. Refer to Figure 1 for measurement equipment setup and follow the procedure below:

1. Connect voltmeter's negative (-) lead to demo board GND test point(TP8 or TP9).
2. Connect voltmeter's positive (+) lead to the demo board VOA(TP2) and VOB(TP5) to measure channel A and channel B output respectively.
3. Connect DC power supply's negative (-) output to demo board GND(TP8 or TP9).
4. Connect DC power supply's positive (+) output (3.1V to 3.5V) to demo board V_{CC} test point(TP7).
 - Do not exceed 3.8V, the absolute maximum supply voltage.**
 - Set VCCN jumper to LO, to turn off the envelope detector if not needed.**
 - Set the Swap jumper to LO for:**
 - VODF= (VOA-VOB)+VOS.**
 - Set swap to HI for:**
 - VODF=(VOB-VOA)+VOS**
5. Connect signal generator's output to demo board INPUT port (SMA connector J1 for channel A input, or J2 for channel B input) via coaxial cable.

6. A 3dB attenuator may be inserted for broadband input match, the detected power range is shifted higher by 3dB.
 7. Set the JP1 to EN to enable the IC. Now the detector is enabled (on) and is ready for measurement.
 8. Apply RF input signal and measure OUTPUT DC voltages at VOA and VOB.
- Do not exceed +18dBm, the absolute maximum RF input power.**

NOTES:

1. The voltage on the EN test point must never exceed $V_{CC} + 0.3V$.
2. For digitally modulated signals, an oscilloscope can be used to observe the AC components of the output.
3. Suggest to set VCCN LO when envelope detector is not used. This will result in lower power consumption.
4. Temperature compensation values for RT1 and RT2 may be different at different frequencies. See table 1 for additional information.

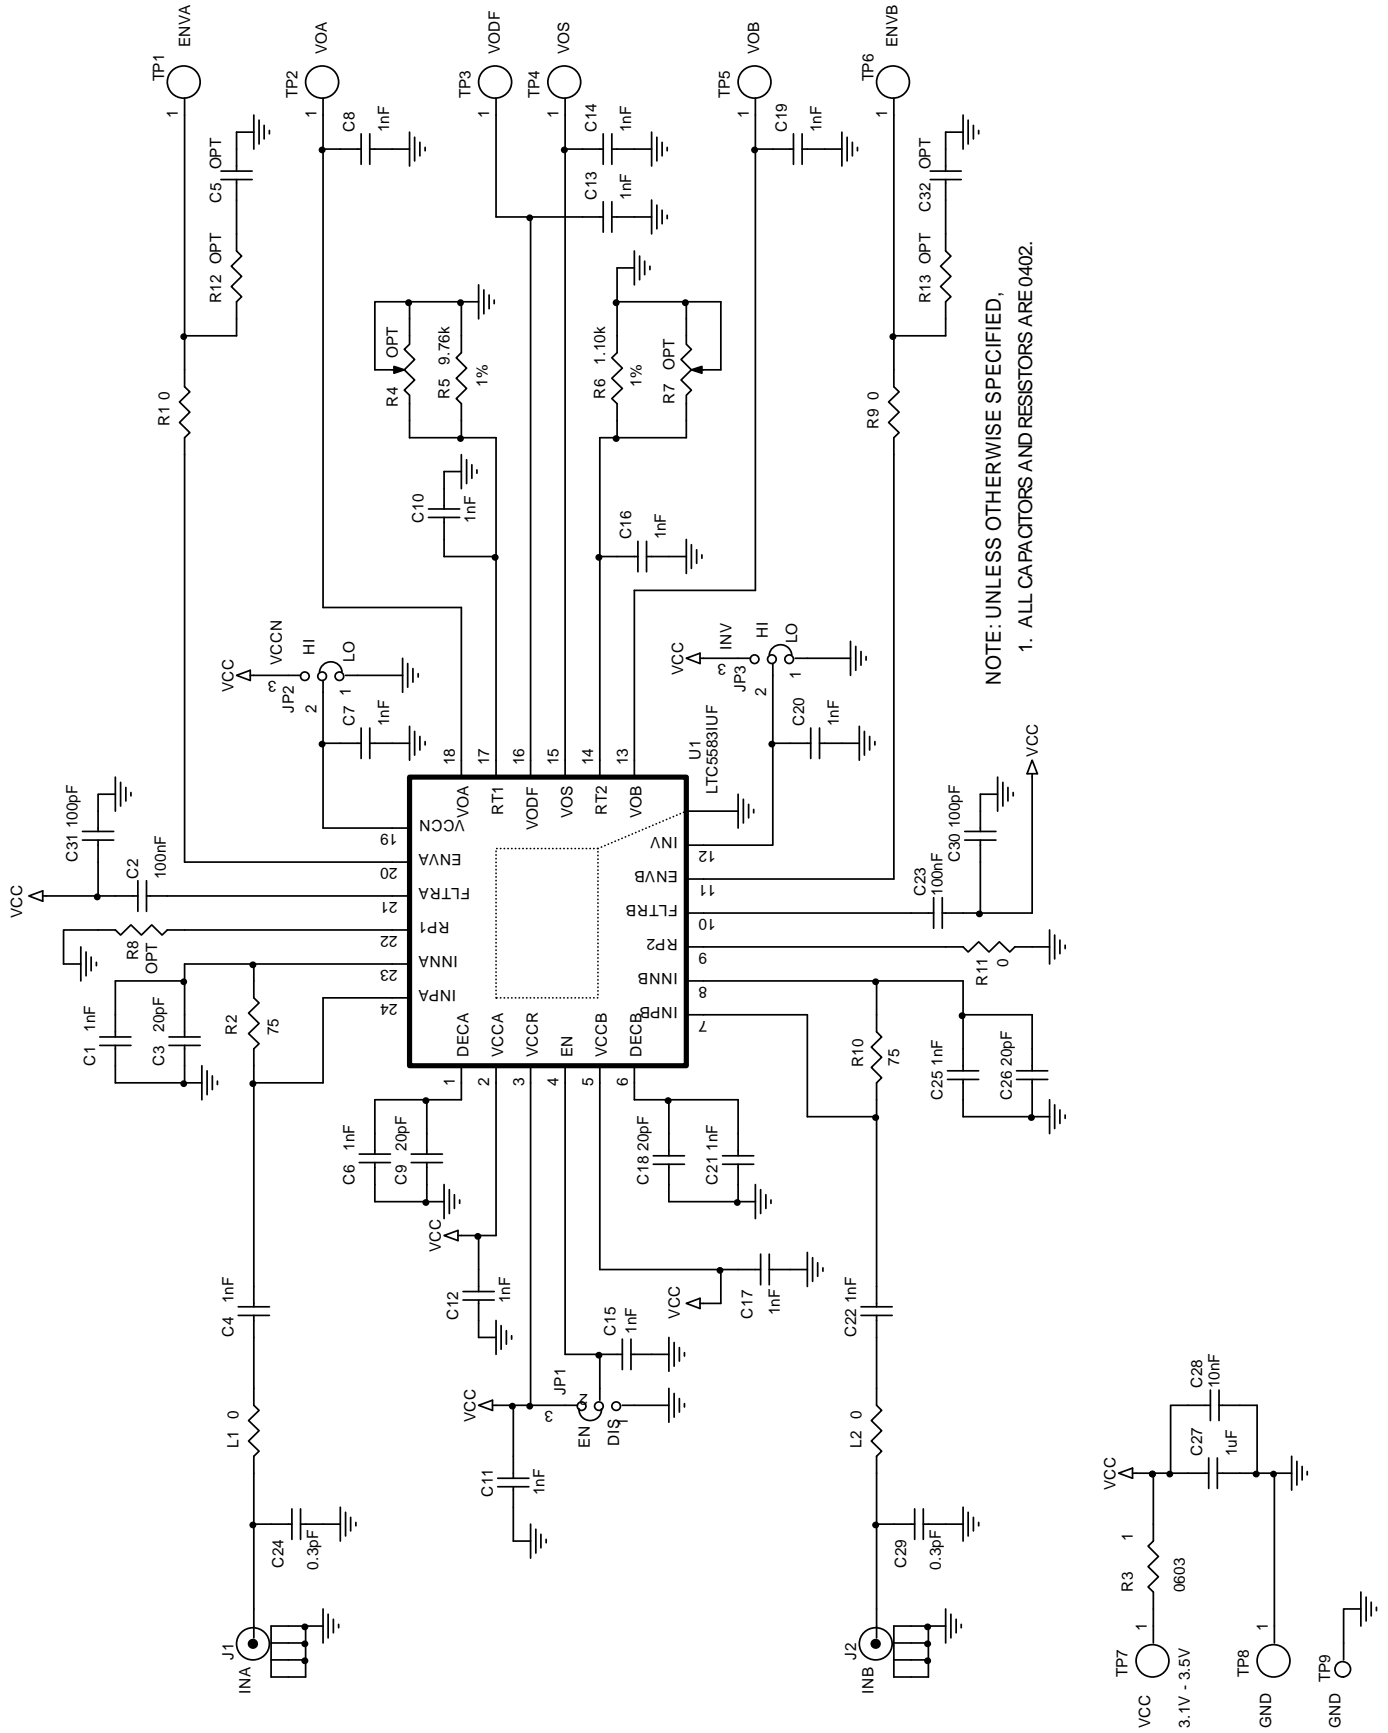

Figure 1. Proper Test Equipment Setup

LTC5583

Frequency (MHz)	RP1 (k Ω)	RP2 (k Ω)	RT1 (k Ω)	RT2 (k Ω)
450	Open	0	11.5	1.13
880	Open	0	11.5	1.13
900	Open	0	11	0.953
1800	Open	0	12.1	1.5
2140	Open	0	9.76	1.1
2300	Open	0	10.5	1.43
2500	Open	0	10.5	1.43
2700	Open	0	8.87	1.21
