

IQS7222A DATASHEET

12 Channel Mutual/ Self-capacitive, Inductive force and Hall sensing controller with I²C communications interface, configurable GPIOs and low power options

1 Device Overview

The IQS7222A ProxFusion® IC is a sensor fusion device for applications that require multiple sensing capabilities from a single sensor IC. The sensor is fully I²C compatible and on-chip calculations enable multiple application options. Various UIs from gestures to power mode switching allows the IC to respond effectively in the intended application with ultra-low power consumption.

1.1 Main Features

- > Highly flexible ProxFusion® device
- > 9 (QFN) / 8 (WLCSP) external sensor pad connections
- > Self-/Mutual capacitive sensors configuration for display wake-up
- > ULP wake-up on touch
 - Dedicated Ultra Low Power wake-up touch sensor
- > Configure up to 12ⁱ Channels using the external connections or internal sensor
- > External sensor options:
 - Up to 8 self capacitive buttons
 - Up to 4 self capacitive wear detection pairs (with physical reference)
 - Up to 10 projected capacitive touch/proximity sensors
 - Up to 4 inductive sensor elements (metal detection/force sensing)
- > Internal sensor options:
 - Hall Switch
- > Built-in basic functions:
 - Automatic tuning
 - Noise filtering
 - Active environment tracking with reference sensor
 - Debounce & Hysteresis
 - Dual direction trigger indication
- > Built-in Signal processing options:
 - Slider output
 - Up to 4 elements per slider
 - Up to 2 sliders simultaneously
 - Slider gesture outputs
- > Design simplicity
 - PC Software for debugging and obtaining optimal settings and performance
 - One-time programmable settings for custom power-on IC configuration
 - Auto-run from programmed settings for simplified integration
- > Automated system power modes for optimal response vs consumption
- > I²C communication interface with IRQ/RDY (up to fast plus -1MHz)
- > Event and streaming modes
- > Customizable user interface due to programmable memory
- > Supply Voltage 1.8V(-5%) to 3.5V
- > Package options
 - WLCSP18 (1.62 x 1.62 x 0.5 mm) - interleaved 0.4mm x 0.6mm ball pitch
 - QFN20 (3 x 3 x 0.5 mm) - 0.4mm pitch

ⁱWLCSP18 package has 1 less external pad connection and the maximum amount of buttons that can be configured are less than QFN20 package

1.2 Applications

- > SAR Compliance in Mobile devices
- > Low power Wake-up Buttons / Proximity
- > Appliance user interface (Slider & Buttons)
- > TWS earphones (touch, slider, wear, force and dock detection)
- > Waterproof Buttons (Inductive)
- > Wear Detection
- > HALL-effect Dock Detection

1.3 Block Diagram

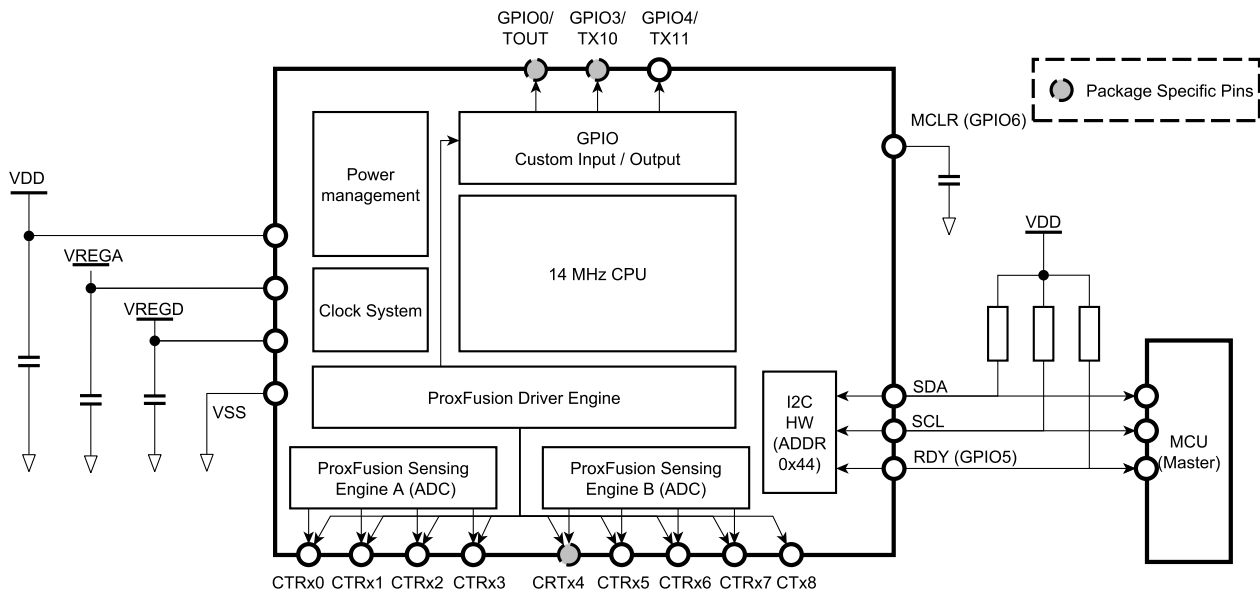

Figure 1.1: Functional Block Diagramⁱⁱ

ⁱⁱWLCSP18 packages do not have a CRX4 and combines GPIO0 and GPIO3

3 Electrical Characteristics

3.1 Absolute Maximum Ratings

Table 3.1: Absolute Maximum Ratings

	Min	Max	Unit
Voltage applied at VDD pin to VSS	1.71	3.5	V
Voltage applied to any ProxFusion® pin	-0.3	VREGA	V
Voltage applied to any other pin (referenced to VSS)	-0.3	VDD + 0.3 (3.5 V max)	V
Storage temperature, T _{stg}	-40	85	°C

3.2 Recommended Operating Conditions

Table 3.2: Recommended Operating Conditions

Recommended operating conditions		Min	Nom	Max	Unit
VDD	Supply voltage applied at VDD pin: F _{OSC} = 14 MHz	1.71		3.5	V
VREGA	Internal regulated supply output for analog domain: F _{OSC} = 14 MHz	1.49	1.53	1.57	V
VREGD	Internal regulated supply output for digital domain: F _{OSC} = 14 MHz	1.56	1.59	1.64	V
VSS	Supply voltage applied at VSS pin		0		V
T _A	Operating free-air temperature	-40	25	85	°C
C _{VDD}	Recommended capacitor at VDD	2×C _{VREGA}	3×C _{VREGA}		μF
C _{VREGA}	Recommended external buffer capacitor at VREGA, ESR ≤ 200 mΩ	2	4.7	10	μF
C _{VREGD}	Recommended external buffer capacitor at VREGD, ESR ≤ 200 mΩ	2	4.7	10	μF
C _{XSELF-VSS}	Maximum capacitance between ground and all external electrodes on all ProxFusion® blocks (self-capacitance mode)	1	-	400 ⁱ	pF
C _{mCTX-CRx}	Capacitance between Receiving and Transmitting electrodes on all ProxFusion® blocks (mutual-cap mode)	0.2	-	9 ⁱ	pF
C _{pCRx-VSS-1M}	Maximum capacitance between ground and all external electrodes on all ProxFusion® blocks (mutual-capacitance mode @ f _{xfer} = 1 MHz)			100 ⁱ	pF
C _{pCRx-VSS-4M}	Maximum capacitance between ground and all external electrodes on all ProxFusion® blocks (mutual-capacitance mode @ f _{xfer} = 4 MHz sensing)			25 ⁱ	pF
$\frac{C_{pCRx-VSS}}{C_{mCTX-CRx}}$	Capacitance ratio for optimal SNR in mutual capacitance mode ⁱⁱ	10		20	n/a
RC _{XCRx/CTX}	Series (in-line) resistance of all mutual capacitance pins (Tx & Rx pins) in mutual capacitance mode	0 ⁱⁱⁱ	0.47	10 ^{iv}	kΩ
RC _{XSELF}	Series (in-line) resistance of all self capacitance pins in self capacitance mode	0 ⁱⁱⁱ	0.47	10 ^{iv}	kΩ

3.3 ESD Rating

Table 3.3: ESD Rating

		Value	Unit
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ^v	±4000	V

3.4 Hall Effect Sensing Characteristics

Figure 3.1: Magnet Trigger Level Description (Active Low Output)

Table 3.4: Example Power-on Magnet Detection Options

Hall Sensor Setup	Output Type	B_{RP} (mT)	B_{OP} (mT)	B_{HYS} (mT)	B_{RP} and B_{OP} Accuracy (mT) -10 °C to 80 °C
Threshold example 1	Direct	2.1	3	0.9	27%
Adjustable Threshold	I ² C/Direct	0 – 100% of B_{OP} (default 95%)	Software register	0 – 100% of B_{OP} (default 5%)	TBD

3.5 Current Consumption

Power mode	Active channels	Report rate	Current [μ A]	
		(Sampling rate) [ms]	3.3V	1.8V
NP	Defaults (10 channels self-capacitance & Hall)	16	450	445
	TWS: Wear, slider, inductive resonant without bias, Hall	16	484	480
LP	Defaults (10 channels self-capacitance & Hall)	60	126	124
	TWS: Wear, slider, inductive resonant without bias, Hall	60	126	125
ULP	Distributed (2 self-capacitance auto-prox channels), default setup	150	6.7	6.1
	Distributed (2 self-capacitance auto-prox channels), TWS setup	150	5.8	5.5

ⁱRCx = 0 Ω

ⁱⁱPlease note that the the maximum values for Cp and Cm are subject to this ratio

ⁱⁱⁱNominal series resistance of 470 Ω is recommended to prevent received and emitted EMI effects. Typical resistance also adds additional ESD protection

^{iv}Series resistance limit is a function of f_{xfer} and the circuit time constant, RC. $R_{max} \times C_{max} = \frac{1}{(6 \times f_{xfer})}$ where C is the pin capacitance to VSS.

^vJEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as \pm 4000 V may actually have higher performance.

4 Timing and Switching Characteristics

4.1 Reset Levels

Table 4.1: Reset Levels

Parameter		Min	Typ	Max	Unit
V _{VDD}	Power-up/down level (Reset trigger) – slope > 100 V/s	1.040	1.353	1.568	V
V _{VREGD}	Power-up/down level (Reset trigger) – slope > 100 V/s	0.945	1.122	1.304	V

4.2 MCLR Pin Levels and Characteristics

Table 4.2: MCLR Pin Characteristics

Parameter		Conditions	Min	Typ	Max	Unit
V _{IL(MCLR)}	MCLR Input low level voltage	VDD = 3.3 V	VSS – 0.3	-	1.05	V
		VDD = 1.7 V			0.75	
V _{IH(MCLR)}	MCLR Input high level voltage	VDD = 3.3 V	2.25	-	VDD + 0.3	V
		VDD = 1.7 V	1.05			
R _{PU(MCLR)}	MCLR pull-up equivalent resistor		180	210	240	kΩ
t _{PULSE(MCLR)}	MCLR input pulse width – no trigger	VDD = 3.3 V	-	-	15	ns
		VDD = 1.7 V			10	
t _{TRIG(MCLR)}	MCLR input pulse width – ensure trigger		250	-	-	ns

Figure 4.1: MCLR Pin Diagram

4.3 Miscellaneous Timings

Table 4.3: Miscellaneous Timings

Parameter		Min	Typ	Max	Unit
f _{xfer}	Charge transfer frequency (derived from f _{OSC})	42	500 – 1500	3500	kHz
f _{OSC}	Master CLK frequency tolerance 14 MHz	13.23	14	14.77	MHz

4.4 Digital I/O Characteristics

Table 4.4: Digital I/O Characteristics

Parameter	Test Conditions	Min	Typ	Max	Unit
V_{OL}	SDA & SCL Output low voltage	$I_{sink} = 20\text{ mA}$		0.3	V
V_{OL}	GPIO ⁱ Output low voltage	$I_{sink} = 10\text{ mA}$		0.15	V
V_{OH}	Output high voltage	$I_{source} = 20\text{ mA}$	$VDD - 0.2$		V
V_{IL}	Input low voltage		$VDD \times 0.3$		V
V_{IH}	Input high voltage			$VDD \times 0.7$	V
C_{b_max}	SDA & SCL maximum bus capacitance			550	pF

4.5 I²C Characteristics

Table 4.5: I²C Characteristics

Parameter	VDD	Min	Typ	Max	Unit
f_{SCL}	1.8 V, 3.3 V			1000	kHz
$t_{HD,STA}$	1.8 V, 3.3 V	0.26			μs
$t_{SU,STA}$	1.8 V, 3.3 V	0.26			μs
$t_{HD,DAT}$	1.8 V, 3.3 V	0			ns
$t_{SU,DAT}$	1.8 V, 3.3 V	50			ns
$t_{SU,STO}$	1.8 V, 3.3 V	0.26			μs
t_{SP}	1.8 V, 3.3 V	0		50	ns

Figure 4.2: I²C Mode Timing Diagram

ⁱRefers to CTx9, CTx10, CTx11, and RDY pins

5 ProxFusion® Module

The IQS7222A contains dual ProxFusion® modules that uses patented technology to measure and process the sensor data. Two modules ensure a rapid response from multi-channel implementations. The multiple touch, proximity and weighted average (slider) outputs are the primary output from the sensor.

5.1 Channel Options

Self-capacitance, Mutual capacitance, Reference tracking, Inductive designs and Hall effect sensing are possible with the IQS7222A.

- > Sensor pad design overview: AZD008
- > Mutual capacitance (also known as Projected capacitance) button layout guide: AZD036
- > Inductive design layout guide: AZD115
- > Hall effect Switch UI Sensing: Section 5.1.1

5.1.1 Hall Effect Switch UI

Hall effect sensing is an internal sensing option that requires no external sensor design.

The Hall effect switch UI measures the magnetic field induced on the hall plate of the IC and is, by default, activated when both Hall-effect channels (channel 10 and channel 11) are active. The UI uses two channels to determine the magnetic field induced on the Hall plate. Using two channels ensures that the ATI (refer to section 5.5) can still be used in the presence of the magnet. An inverted channel allows the capability of calculating a reference value which will always be the same regardless of the presence of a magnet. Enabling the UI will enable the IC to display the effects of the magnet by reading the data in the Hall UI flags and output registers.

The Hall effect switch UI is used for detection of the presence of a single magnet.

There are two channel outputs and each channel controls different parameters of the Hall effect. Please note that parameters not listed under the relevant channel's setting, below, must be left as default.

Channel 10 output is the signal output, calculated using:

$$\text{Channel 10}_{\text{output}} = \frac{\text{Counts} - \text{Counts}_{\text{inv}}}{2}$$

Settings from Channel 10 used for Hall effect switch UI:

- > Touch Threshold
- > Prox Threshold
- > Touch Hysteresis
- > Enter debounce
- > Exit debounce

Channel 11 output is the LTA and signal without the output on Channel10, calculated using:

$$\text{Channel 11}_{\text{output}} = \frac{\text{Counts} + \text{Counts}_{\text{inv}}}{2}$$

Channel 11 allows ATI to be performed without changing the count value on Channel 10.

Settings from Channel 11 used for Hall effect switch UI:

- > ATI Mode
- > ATI Band
- > ATI Compensation
- > ATI Compensation Divider
- > ATI Coarse Fractional Divider
- > ATI Coarse Fractional Multiplier
- > ATI Fine Fractional Divider

Settings that should be the same on channel 10 and channel 11 are:

- > Frequency fraction
- > Frequency period
- > Ground inactive Rx's
- > Vref 0v5 Enable
- > Cs cap size
- > ATI Base
- > ATI Target

5.2 Low Power Options

The IQS7222A offers 3 power modes:

- > Normal power mode (NP)
 - Flexible key scan rate
- > Lower power mode (LP)
 - Flexible key scan rate
 - Typically set to a slower rate than NP
- > Ultra-low power mode (ULP)
 - Optimized firmware setup
 - Intended for rapid wake-up on a single channel (e.g. distributed proximity event), enabling immediate button response for an approaching user
 - Other sensor channels are typically sampled at a slower rate in order to optimize power consumption

5.3 Count Value

The sensing measurement returns a *count value* for each channel. Count values are inversely proportional to capacitance/inductance, and all outputs are derived from this.

5.3.1 Max Count

Each channel is limited to having a count value smaller than the configurable limit (*Maximum counts*). If the ATI setting or hardware causes measured count values higher than this, the conversion will be stopped, and the max value will be read for that relevant count value.

5.4 Reference Value/Long-Term Average (LTA)

User interaction is detected by comparing the measured count values to some reference value. The reference value/LTA of a sensor is slowly updated to track changes in the environment and is not updated during user interaction.

5.4.1 Reseed

Since the *Reference* for a channel is critical for the device to operate correctly, there could be known events or situations which would call for a manual reseed. A reseed takes the latest measured counts, and seeds the *reference/LTA* with this value, therefore updating the value to the latest environment. A reseed command can be given by setting the corresponding bit (Register 0xD0, bit3).

5.5 Automatic Tuning Implementation (ATI)

The ATI is a sophisticated technology implemented in the new ProxFusion® devices to allow optimal performance of the devices for a wide range of sensing electrode capacitances and inductance, without modification to external components. The ATI settings allow tuning of various parameters. For a detailed description of ATI, please contact Azoteq.

5.6 Automatic Re-ATI

5.6.1 Description

Re-ATI will be triggered if certain conditions are met. One of the most important features of the Re-ATI is that it allows easy and fast recovery from an incorrect ATI, such as when performing ATI during user interaction with the sensor. This could cause the wrong ATI Compensation to be configured, since the user affects the capacitance of the sensor. A Re-ATI would correct this. It is recommended to always have this enabled. When a Re-ATI is performed on the IQS7222A, a status bit will set momentarily to indicate that this has occurred.

5.6.2 Conditions for Re-ATI to activate

A Re-ATI is performed when the reference of a channel drifts outside of the acceptable range around the ATI Target. The boundaries where Re-ATI occurs for the channels are adjustable in registers listed in Table A.16.

$$\text{Re-ATI Boundary}_{\text{default}} = \text{ATI target} \pm \left(\frac{1}{8}\text{ATI Target}\right)$$

For example, assume that the ATI target is configured to 800 and that the and the default boundary value is $1/8 * 800 = 100$. If Re-ATI is enabled, the ATI algorithm will be repeated under the following conditions:

$$\text{Reference} > 900 \text{ or } \text{Reference} < 700$$

The ATI algorithm executes in a short time, so goes unnoticed by the user.

5.6.3 ATI Error

After the ATI algorithm is performed, a check is done to see if there was any error with the algorithm. An ATI error is reported if one of the following is true for any channel after the ATI has completed:

- > ATI Compensation = 0 (min value)
- > ATI Compensation \geq 1023 (max value)
- > Count is already outside the Re-ATI range upon completion of the ATI algorithm

If any of these conditions are met, the corresponding error flag will be set (*ATI Error*). The flag status is only updated again when a new ATI algorithm is performed.

Re-ATI will not be repeated immediately if an ATI Error occurs. A configurable time (*ATI error timeout*) will pass where the Re-ATI is momentarily suppressed. This is to prevent the Re-ATI repeating indefinitely. An ATI error should however not occur under normal circumstances.

6 Sensing Modes

6.1 Mode Timeout

In order to optimize power consumption and performance, power modes are "stepped" by default in order to move to power efficient modes when no interaction has been detected for a certain (configurable) time known as the "mode timeout". The value for the power mode to never timeout (i.e. the current power mode will never progress to a lower power mode), is 0x00.

6.2 Count Filter

6.2.1 IIR Filter

The IIR filter applied to the digitized raw input offers various damping options as defined in Table A.23 and Table A.24

$$\text{Damping factor} = \text{Beta}/256$$

7 Hardware Settings

Settings specific to hardware and the ProxFusion® Module charge transfer characteristics can be changed.

Below, some are described, the other hardware parameters are not discussed as they should only be adjusted under guidance of Azoteq support engineers.

7.1 Charge Transfer Frequency

The charge transfer frequency (f_{xfer}) can be configured using the product GUI, and the relative parameters (*Charge Transfer frequency*) will be provided. For high resistance sensors, it might be needed to decrease f_{xfer} .

7.2 Reset

7.2.1 Reset Indication

After a reset, the *Reset* bit will be set by the system to indicate the reset event occurred. This bit will clear when the master sets the *Ack Reset*, if it becomes set again, the master will know a reset has occurred, and can react appropriately.

While *Reset* bit remains set:

- > The device will not be able to enter into I²C Event mode operation (i.e. streaming communication behavior will be maintained until the Reset bit is cleared)
- > During the period of ATI execution, the device will provide communication windows continuously during the ATI process, resulting in much longer time to finish the ATI routine.

7.2.2 Software Reset

The IQS7222A can be reset by means of an I²C command (*Soft Reset*).

8 Additional Features

8.1 Setup Defaults

The supplied GUI can be utilised to configure the optimal settings. The design specific settings are exported and can be written to the device by the master after every power-on reset.

8.2 Automated Start-up

The device is programmed with the application firmware, bundled with settings specifically configured for the current hardware as described in Section 8.1. After power-up the device will automatically use the settings and perform the configuration/setup accordingly.

8.3 RF Immunity

The IQS7222A has immunity to high power RF noise. To improve the RF immunity, extra decoupling capacitors are suggested on V_{REG} and V_{DD} .

Place a 100pF in parallel with the 2.2 μ F ceramic on V_{REG} . Place a 4.7 μ F ceramic on V_{DD} . All decoupling capacitors should be placed as close as possible to the V_{DD} and V_{REG} pads.

If needed, series resistors can be added to Rx electrodes to reduce RF coupling into the sending pads. Normally these are in the range of 470 Ω -1k Ω . PCB ground planes also improve noise immunity.

9 I²C Interface

9.1 I²C Module Specification

The device supports a standard two wire I²C interface with the addition of an RDY (ready interrupt) line. The communications interface of the IQS7222A supports the following:

- > *Fast-mode-plus* standard I²C up to 1MHz.
- > Streaming data as well as event mode.
- > The provided interrupt line (RDY) is an open-drain active low implementation and indicates a communication window.

The IQS7222A implements 8-bit addressing with 2 bytes at each address with the exception of extended addresses, which implement 16-bit addressing with 2 bytes at each address. Two consecutive read/writes are required in this memory map structure. The two bytes at each address will be referred to as "byte 0" (least significant byte) and "byte 1" (most significant byte).

9.2 I²C Address

The default 7-bit device address is 0x44 ('01000100'). The full address byte will thus be 0x89 (read) or 0x88 (write).

Other address options exist on special request. Please contact Azoteq.

9.3 I³C Compatibility

This device is not compatible with an I³C bus due to clock stretching allowed for data retrieval.

9.4 Memory Map Addressing

9.4.1 8-bit Address

Most of the memory map implements an 8-bit addressing scheme for the required user data. Extended memory map addresses implement 16-bit addressing scheme.

9.4.2 Extended 16-bit Address

For development purposes, larger blocks of data are found in an extended 16-bit memory addressable location. It is possible to only address each Block as an 8-bit address, and then continue to clock into the next address locations. For example, if the procedure depicted below is followed, you will read the values from the hypothetical address 0xE000 to 0XE300:

Figure 9.1: Extended 16-bit Addressing for Continuous Block

However, if you need to address a specific byte in that extended memory map space, then you will need to address using the full 16-bit address (note the 16-bit address is high byte first, unlike the data which is low byte first):

Figure 9.2: Extended 16-bit Addressing for a Specific Register

9.5 Data

The data is 16-bit words, meaning that each address obtains 2 bytes of data. For example, address 0x10 will provide two bytes, then the next two bytes read will be from address 0x11.

The 16-bit data is sent in little endian byte order (least significant byte first).

The h file generated by the GUI will display the start address of each block of data, with each address containing 2 bytes. The data of all the addresses can be written consecutively -in a single block of data or the entire memory map, (refer to figure 9.1), or data can be written explicitly to a specific address (refer to figure 9.2). An example of the h file exported by the GUI and the order of the data, is shown in figure 9.3 below.

```

/* Change the Sensor 0 Settings */
/* Memory Map Position 0x30 - 0x39 */
#define SENSOR_0_SETUP_0          0x01  →  LSB
#define SENSOR_0_SETUP_1          0x07  →  MSB

```

Figure 9.3: Example of an H file Exported by the GUI

9.6 I²C Timeout

If the communication window is not serviced within the *I²C timeout* period (in milliseconds), the session is ended (RDY goes HIGH), and processing continues as normal. This allows the system to continue and keep reference values up to date even if the master is not responsive, however the corresponding data was missed/lost, and this should be avoided. The default I²C timeout period is set to 500ms and can be adjusted in register 0xDD .

9.7 Terminate Communication

A standard I²C STOP ends the current communication window.

If the stop bit disable (bit 0 register 0xDC) is cleared, the device will not respond to a standard I²C STOP. The communication window must be terminated using the end communications command (0xFF).

Figure 9.4: Force Stop Communication Sequence

9.8 RDY/IRQ

The communication has an open-drain active-LOW RDY signal to inform the master that updated data is available. It is optimal for the master to use this as an interrupt input and obtain the data accordingly. It is also useful to allow the master MCU to enter low-power/sleep allowing wake-up from the touch device when user presence is detected. It is recommended that the RDY be placed on an interrupt-on-pin-change input on the master.

9.9 Invalid Communications Return

The device will give an invalid communication response (0xEE) under the following conditions:

- > The host is trying to read from a memory map register that does not exist.
- > The host is trying to read from the device outside of a communication window (i.e. while RDY = high)

9.10 I²C Interface

The IQS7222A has 3 *I²C interface options*, as described in the sections below.

9.10.1 I²C Streaming

I²C Streaming mode refers to constant data reporting at the relevant power mode report rate specified in register 0xD4 (normal power), register 0xD6 (low power) and register 0xD8 (ultra low power)

respectively.

9.10.2 I²C Event Mode

The device can be set up to bypass the communication window when no activity is sensed (EVENT MODE). This is usually enabled since the master does not want to be interrupted unnecessarily during every cycle if no activity occurred. The communication will resume (RDY will indicate available data) if an enabled event occurs.

9.10.3 I²C Stream in Touch Mode

Stream in touch is a hybrid I²C mode between streaming mode and event mode. The device follows event mode I²C protocol but when a touch is registered on any channel, the device enters streaming mode until the touch is released.

The hybrid I²C interface is specifically aimed at the use of sliders where data needs to be received and processed for the duration of a touch.

9.11 Event Mode Communication

Event mode can only be entered if the following requirements are met:

- > Reset bit must be cleared by acknowledging the device reset condition occurrence through writing Ack Reset bit to clear the System status flag.
- > Events must be serviced by reading from the Events register 0x11 to ensure all events flags are cleared otherwise continuous reporting (RDY interrupts) will persist after every conversion cycle similar to streaming mode

9.11.1 Events

Numerous events can be individually enabled to trigger communication, bit definitions can be found in Table A.2 and Table A.3:

- > Power mode change
- > Prox or touch event
- > ATI error
- > ATI active
- > ATI Event
- > Slider Event

9.11.2 Force Communication

In streaming mode, the IQS7222A I²C will provide Ready (RDY) windows at intervals specified in the power mode report rate . Ideally, communication with the IQS7222A should only be initiated in a Ready window but a communication request described in figure 9.5 below, will force a Ready window to open. In event mode Ready windows are only provided when an event is reported and a Ready window must be requested to write or read settings outside of this window. The minimum and maximum time between the communication request and the opening of a RDY window (t_{wait}), is application specific, but the average values are $0.1ms \leq t_{wait} \leq 45ms$ ⁱ.

ⁱPlease contact Azoteq for an application specific value of t_{wait}

The communication request sequence is shown in figure 9.5 below.

Figure 9.5: Force Communication Sequence

9.12 Program Flow Diagram

The program flow for event mode communication is shown in 9.6

Figure 9.6: Program Flow Diagram

11 Implementation and Layout

11.1 Layout Fundamentals

NOTE

Information in the following Applications section is not part of the Azoteq component specification, and Azoteq does not warrant its accuracy or completeness. Azoteq's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

11.1.1 Power Supply Decoupling

Azoteq recommends connecting a combination of a 4.7 μF plus a 100 pF low-ESR ceramic decoupling capacitor between the VDD and VSS pins. Higher-value capacitors may be used but can impact supply rail ramp-up time. Decoupling capacitors must be placed as close as possible to the pins that they decouple (within a few millimetres).

Figure 11.1: Recommended Power Supply Decoupling

11.1.2 VREG

The VREG pin requires a 2.2 μF capacitor to regulate the LDO internal to the device. This capacitor must be placed as close as possible to the microcontroller. The figure below shows an example layout where the capacitor is placed close to the IC.

Figure 11.2: VREG Capacitor Placement Close to IC

11.1.3 WLCSP Light Sensitivity

The CSP package is sensitive to infrared light. When the silicon IC is subject to the photo-electric effect, an increase in leakage current is experienced. Due to the low power consumption of the IC this causes a change in signal and is common in the semiconductor industry with CSP devices.

If the IC could be exposed to IR in the product, then a dark glob-top epoxy material should cover the complete package to block infrared light. It is important to use sufficient material to completely cover the corners of the package. The glob-top also provides further advantages such as mechanical strength and shock absorption.

Conversion Frequency Period								Conversion Frequency Fraction							

- > **Bit 8-15: Conversion Frequency Period**
 - The calculation of the charge transfer frequency (f_{xfer} is shown below. The relevant formula is determined by the value of the dead time enabled bit (refer to table A.8)
 - Dead time disabled: $f_{xfer} = \frac{f_{clk}}{2 * period + 2}$
 - Dead time enabled: $f_{xfer} = \frac{f_{clk}}{2 * period + 3}$
 - Range: 0 - 127
- > **Bit 0-7: Conversion Frequency Fraction**
 - $256 * \frac{f_{conv}}{f_{clk}}$
 - Range: 0 - 255

- > Note: if Conversion frequency fraction is fixed at 127 and dead time is enabled, the following values of the conversion period will result in the corresponding charge transfer frequencies:
 - 1: 2MHz
 - 5: 1MHzⁱ
 - 12: 500kHz
 - 17: 350kHz
 - 26: 250kHz
 - 53: 125kHz

Table A.30: Delta Link

Register: 0xB005, 0xB006, 0xB007, 0xB008, 0xB105, 0xB106, 0xB107, 0xB108															
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Delta Link															

- > Bit 0-15: **Delta Link - Select element order per channel**
- > Delta link number corresponds with slider element order
 - 0x000 (decimal = 0): Disabled
 - 0x438 (decimal = 1080): Channel 0 enabled for element
 - 0x462 (decimal = 1122): Channel 1 enabled for element
 - 0x48C (decimal = 1164): Channel 2 enabled for element
 - 0x4B6 (decimal = 1206): Channel 3 enabled for element
 - 0x4E0 (decimal = 1248): Channel 4 enabled for element
 - 0x50A (decimal = 1290): Channel 5 enabled for element
 - 0x534 (decimal = 1332): Channel 6 enabled for element
 - 0x55E (decimal = 1374): Channel 7 enabled for element
 - 0x588 (decimal = 1416): Channel 8 enabled for element
 - 0x5B2 (decimal = 1458): Channel 9 enabled for element

Table A.31: Gesture Setup 0

Register: 0xB009, 0xB19A															
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Maximum Tap Time								Minimum Tap Time				Flick En	Swipe En	Tap En	

- > Bit 8-15: **Maximum Tap Time**
 - 8-bit value * 16 (ms)
- > Bit 3-7: **Minimum Tap Time**
 - 5-bit value * 16 (ms)
- > Bit 2: **Flick Gesture Enable**
 - 0: Flick Disabled
 - 1: Flick Enabled
- > Bit 1: **Swipe Gesture Enable**
 - 0: Swipe Disabled
 - 1: Swipe Enabled
- > Bit 0: **Tap Gesture Enable**
 - 0: Tap Disabled
 - 1: Tap Enabled

Table A.32: Gesture Setup 1

Register: 0xB00A, 0xB10A															
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Minimum Swipe Distance								Maximum Swipe Time							

- > **Bit 8-15: Minimum Swipe Distance**
 - 8-bit value * 16 (pixels)
- > **Bit 0-7: Maximum Swipe Time**
 - 8-bit value * 16 (ms)

Table A.33: GPIO0 Enable and Configuration Settings

Register: 0xC000															
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Reserved														Config-uration	Enable

- > **Bit 0: Enable**
 - 0: GPIO0 Output disabled
 - 1: GPIO0 Output Enabled
- > **Bit 1: Output Configuration**
 - 0: Push pull active high logic
 - 1: Open Drain active low logic (requires additional pull-up resistance to VDD level, no internal pull-up)

Table A.34: GPIO0 Enable Mask

Register: 0xC001																
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0	
Channel Enable Mask (Status link = 0x06E6/ 0x06E8)																
Reserved						CH10	CH9	CH8	CH7	CH6	CH5	CH4	CH3	CH2	CH1	CH0
Slider Event Enable Mask (Status link = 0x0620/ 0x063E)																
Reserved													Flick	Swipe	Tap	

- > Please note that more than one channel can be selected as an output
- > **Bit 0-7: Channel Enable Mask** - Status link = Prox/Touch (0x06E6/0x06E8)
 - 0: Disabled
 - 1: Channel 0 enabled as output
 - 2: Channel 1 enabled as output
 - 4: Channel 2 enabled as output
 - 8: Channel 3 enabled as output
 - 16: Channel 4 enabled as output
 - 32: Channel 5 enabled as output
 - 64: Channel 6 enabled as output
 - 128: Channel 7 enabled as output
- > **Bit 8-9: Channel Enable Mask** - Status link = Prox/Touch (0x06E6/0x06E8)
 - 256: Channel 8 enabled as output
 - 512: Channel 9 enabled as output
 - 1024: Channel 10/Hall Switch enabled as output
- > **Bit 0-2: Slider Event Enable Mask** - Status link = Slider 0/ Slider 1 (0x0620/0x063E)
 - 0: Tap
 - 1: Swipe
 - 2: Flick

Table A.35: Enable Status Link

Register: 0xC002															
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Enable Status Link															

- > **Bit 0-15: Enable Status Link**
 - 0x06E6 (decimal = 1766): Output linked to channel prox
 - 0x06E8 (decimal = 1768): Output linked to channel touch

- 0x0620 (decimal = 1568): Slider 0 event enabled as output
- 0x063E (decimal = 1598): Slider 1 event enabled as output

Table A.36: Control Settings

Register: 0xD0															
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Reserved								Interface type		Power mode		Reseed	Re-ATI	Soft Reset	ACK Reset

 - 0: Power event masked
 - 1: Power event enabled

- > **Bit 12: ATI Event**
 - 0: ATI event masked
 - 1: ATI event enabled
- > **Bit 11: Slider 1 Event**
 - 0: Slider 1 event masked
 - 1: Slider 1 event enabled
- > **Bit 10: Slider 0 Event**
 - 0: Slider 0 event masked
 - 1: Slider 0 event enabled
- > **Bit 1: Touch Event**
 - 0: Touch event masked
 - 1: Touch event enabled
- > **Bit 0: Prox Event**
 - 0: Prox event masked
 - 1: Prox event enabled

Table A.39: Hall Bias an Offset Current

Register: 0xDB															
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Hall Coarse Offset				Hall Fine Offset				Boost Gain	Hall Bias						

- > **Bit 12-15: Hall Coarse Offset**
 - Coarse offset current in 3 μ A steps.
 - Range -21 μ A to 21 μ A
- > **Bit 8-11: Hall Fine Offset**
 - 4 bit value * 200 (nA)
- > **Bit 7: Boost Gain**
 - 0: Boost gain disabled
 - 1: Boost gain enabled
- > **Bit 0-6: Hall Bias Current**
 - 7 bit value

Table A.40: I²C Communication

Register: 0xDC															
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Reserved												Stop re-ceived	Start re-ceived	RW check dis-abled	Stop bit dis-abled

- > **Bit 3: Stop Received Flag**
 - 0: No I²C stop received
 - 1: I²C stop received
- > **Bit 2: Start Received Flag**
 - 0: No I²C start received
 - 1: I²C start received
- > **Bit 1: RW Check Disabled**
 - 0: Write not allowed to read only registers
 - 1: Read and write allowed to read only registers
- > **Bit 0: Stop Bit Disabled**
 - 0: I²C communication window terminated by stop bit.
 - 1: I²C communication window not terminated by stop bit. Send 0xFF to slave address to terminate window

Table A.41: I²C Communication Timeout

Register: 0xDD															
Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
I ² C Communication Timeout															

- > **Note:** I²C To write to this register, the register's address (0xDD) must be commanded explicitly before writing data i.e. in a separate I²C write setup command.
- > **Bit 0-15: I²C Communication Timeout**

- 16-bit value [ms]
- Range: 0 - 64535
- Default = 500ms

B Revision History

Release	Date	Changes
v0.3	April 2021	Initial release
v1.0	September 2021	Initial release
v1.1	March 2022	Tape and Reel information added Slider events added to Table A.3 Hall boost gain bit definition corrected Firmware version changed to v1.15 Reference schematic updated Bit definition for Read-write check corrected Changed Communication protocol description Read-write permissions added in memory map Stop-bit disable bit definition corrected Revision history added I ² C section extended to include force communication and invalid communication request information Register 0xDD added VREGA electrical characteristics corrected Bit and register names changed to follow user guide and GUI conventions Example of h file from GUI and program flow diagram added. Schematic capacitor values corrected

C Known Issues

V1.13 and earlier: Polling during start-up may result in device lockup. Suspend polling for at least 25ms after receiving a NACK.

The I²C initialize can fail if one of the I²C lines have been kept low for longer than 50ms.
