HMC713MS8 / 713MS8E

v06.0412

54 dB, LOGARITHMIC DETECTOR / CONTROLLER, 45 - 2700 MHz

Typical Applications

The HMC713MS8(E) is ideal for:

- Cellular Infrastructure
- WiMAX, WiBro & LTE/4G
- Power Monitoring & Control Circuitry
- Receiver Signal Strength Indication (RSSI)
- Automatic Gain & Power Control
- Military, ECM & Radar

Features

Wide Dynamic Range: up to 54 dB

High Accuracy:
±1 dB with 54 dB Range Up To 2.7 GHz

Fast Output Response Time

Supply Voltage: +2.7 to +5.5V

Power-Down Mode

Excellent Stability over Temperature

MSOP-8 SMT Package: 14.8 mm²

General Description

The HMC713MS8(E) Logarithmic Detector/Controller is ideal for converting RF signals with frequencies in the 45 MHz to 2700 MHz range, to a proportional DC voltage at its output. The HMC713MS8(E) employs a successive compression technology which delivers 54 dB of dynamic range with high conversion accuracy over a wide input frequency range. As the input signal is increased, successive amplifiers move into saturation one by one creating an accurate approximation of the logarithm function. The outputs of a series of detectors are summed, converted into voltage domain and buffered to drive the OUT output. For detection mode, the OUT pin is connected to the VSET input and will provide a nominal logarithmic slope of 17 mV/dB and an intercept of -68 dBm. The HMC713MS8(E) can also be used in the controller mode where an external voltage is applied to the VSET pin to create an AGC or APC feedback loop.

Electrical Specifications, T_A = +25 °C, Vcc= +3V [1]

Pin Descriptions

Pin Number	Function	Description	Interface Schematic
1	INP	RF input pin.	2	EN	Enable pin. Apply VEN >0.8 x Vcc for normal operation. Apply VEN <0.2xVcc to disable the HMC713MS8E and reduce supply current to 0.3mA. To ensure proper start-up apply the power-up sequence shown in the "Power-Up Timing Diagram" attached to the application circuit.	3	VSET	Set point input for controller mode. Connect to OUT with the resistor network shown in evaluation board drawing for detector mode.	4	CLPF	Connection for ground referenced external lowpass filter capacitor.	5	GND	Device ground.

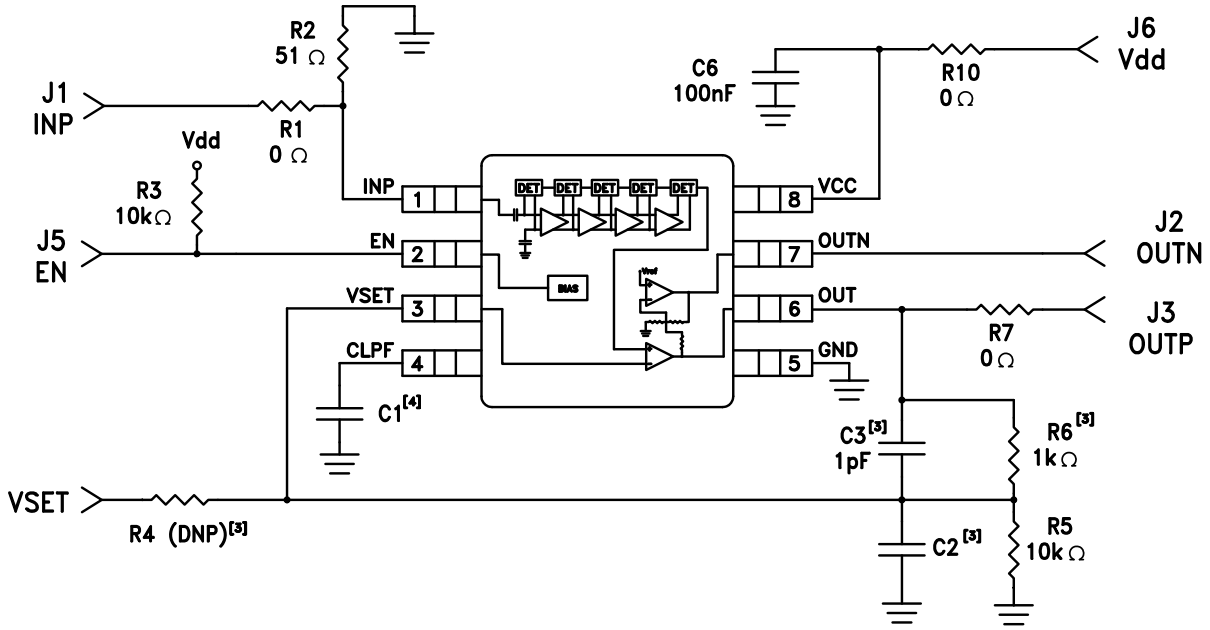
Application & Evaluation PCB Schematic



Notes

Note 1: The HMC713MS8(E) evaluation board is pre-assembled for single-ended input, and detector/RSSI mode.

Note 2: For detector mode, connect high impedance volt meter to the OUT / OUTN port.

Note 3: For controller mode, remove R6 & C3 and install 1k Ω resistor (R4) and 100pF capacitor (C2), then make appropriate connection to OUT and VSET. In controller mode, the OUT / OUTN output can be used to drive a variable gain amplifier, or a variable attenuator, either directly or through a buffer or microcontroller. VSET should be connected to an external supply, typically between +0.2 and +1.2V.

Note 4: An external capacitance C1 can be connected to CLPF port for additional filtering of OUT and OUTN outputs..

[2] Circuit Board Material: Arlon 25FR or Rogers 4350

The circuit board used in the application should use RF circuit design techniques. Signal lines should have 50 ohm impedance while the package ground leads and exposed paddle should be connected directly to the ground plane similar to that shown. A sufficient number of via holes should be used to connect the top and bottom ground planes. The evaluation circuit board shown is available from Hittite upon request.
