

Crystal to LVPECL Clock Generator

Features

- One LVPECL Output Pair
- Selectable output frequency: 156.25 MHz or 187.5 MHz
- External crystal frequency: 25 MHz
- Low root mean square (RMS) phase jitter at 156.25 MHz, using 25 MHz crystal (1.875 MHz to 20 MHz): 0.33 ps (typical)
- Pb-free 8-Pin thin shrunk small outline package (TSSOP) Package
- Supply voltage: 3.3 V or 2.5 V
- Commercial and industrial temperature ranges

Functional Description

The CY2XP24 is a PLL (phase locked loop) based high performance clock generator. It is optimized to generate 10 Gb Ethernet, Fibre Channel, and other high performance clock frequencies. It produces an output frequency that is either 6.25 times or 7.5 times the crystal frequency. It uses Cypress's low noise VCO technology to achieve low phase jitter, that meets both 10 Gb Ethernet, Fibre Channel, and SATA jitter requirements. The CY2XP24 has a crystal oscillator interface input and one LVPECL output pair.

Note

1. The voltage on any input or I/O pin cannot exceed the power pin during power up. Power supply sequencing is NOT required.
2. Simulated using Apache Sentinel T1 software. The board is derived from the JEDEC multilayer standard. It measures 76 x 114 x 1.6 mm and has 4-layers of copper (2/1/1/2 oz.). The internal layers are 100% copper planes, while the top and bottom layers have 50% metalization. No vias are included in the model.

Application Information

Power Supply Filtering Techniques

As in any high speed analog circuitry, noise at the power supply pins can degrade performance. To achieve optimum jitter performance, use good power supply isolation practices. Figure 8 illustrates a typical filtering scheme. Because all current flows through pin 1, the resistance and inductance between this pin and the supply is minimized. A 0.01 or 0.1 μF ceramic chip capacitor is also located close to this pin to provide a short and low impedance AC path to ground. A 1 to 10 μF ceramic or tantalum capacitor is located in the general vicinity of this device and may be shared with other devices.

Figure 8. Power Supply Filtering

Termination for LVPECL Output

The CY2XP24 implements its LVPECL driver with a current steering design. For proper operation, it requires a 50 ohm dc termination on each of the two output signals. For 3.3 V operation, this data sheet specifies output levels for termination to $V_{DD}-2.0$ V. This termination voltage can also be used for $V_{DD} = 2.5$ V operation, or it can be terminated to $V_{DD}-1.5$ V. Note that it is also possible to terminate with 50 ohms to ground (V_{SS}), but the high and low signal levels differ from the data sheet values. Termination resistors are best located close to the destination device. To avoid reflections, trace characteristic impedance (Z_0) should match the termination impedance. Figure 9 shows a standard termination scheme.

Figure 9. LVPECL Output Termination

Crystal Input Interface

The CY2XP24 is characterized with 18 pF parallel resonant crystals. The capacitor values shown in Figure 10 are determined using a 25 MHz 18 pF parallel resonant crystal and are chosen to minimize the ppm error. Note that the optimal values for C1 and C2 depend on the parasitic trace capacitance and are therefore layout dependent.
