

# DS1181L

# 20MHz to 134MHz Spread-Spectrum Clock Modulator for LCD Panels

## General Description

The DS1181L is a spread-spectrum clock modulator IC that reduces EMI in high clock-frequency-based, digital electronic equipment.

Using an integrated phase-locked loop (PLL), the DS1181L accepts an input clock signal in the range of 20MHz to 134MHz and delivers a spread-spectrum modulated output clock signal. The PLL modulates, or dithers, the output clock about the center input frequency at a pin-selectable magnitude, allowing direct EMI control and optimization. In addition, through an enable pin the dithering can be enabled or disabled for easy comparison of system performance during EMI testing. This same input pin also allows the DS1181L output to be three-stated.

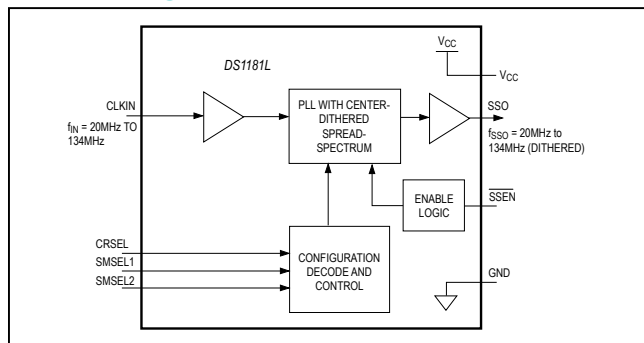

By dithering the system clock, all the address, data, and timing signals generated from this signal are also dithered so that the measured EMI at the fundamental and harmonic frequencies is greatly reduced. This is accomplished without changing clock rise/fall times or adding the space, weight, design time, and cost associated with mechanical shielding.

The DS1181L is provided in an 8-pin TSSOP package and operates over a full automotive temperature range of -40°C to +125°C.

## Applications

- LCD Panels for TVs, Desktop Monitors, and Notebook and Tablet PCs
- Printers

## Block Diagram

## Features

- Modulates a 20MHz to 134MHz Clock with Center Spread-Spectrum Dithering
- Selectable Spread-Spectrum Modulation Magnitudes of:
  - ±0.5%
  - ±1.0%
  - ±1.5%
  - ±2.0%
- Low 75ps Cycle-to-Cycle Jitter
- Spread-Spectrum Disable Mode
- Pin Compatible with Alliance/PulseCore Semiconductor P2040 Series Devices
- Clock Output Disable
- Low Cost
- Low Power Consumption
- 3.3V Single Voltage Supply
- -40°C to +125°C Temperature Range
- Small 8-Pin TSSOP Package

## Detailed Description

The DS1181L modulates an input clock to generate a center-dithered spread-spectrum output. A 20MHz to 134MHz clock is applied to the CLKIN pin. An internal PLL dithers the output clock about its center frequency at a user-selectable magnitude.

### Spread-Spectrum Dither Magnitude

The DS1181L can generate dither magnitudes up to  $\pm 2\%$ . The desired magnitude is selected using input pins SMSEL1 and SMSEL2 as shown in Table 1.

**Table 1. Dither Magnitude**

SMSEL2	SMSEL1	MAGNITUDE SELECTED (%)
0	0	$\pm 2.0$
0	1	$\pm 1.5$
1	0	$\pm 1.0$
1	1	$\pm 0.5$

### Spread-Spectrum Dither Rate

The output spread-spectrum dither rate is fixed at  $f_{IN}/832$ .

**Table 2. Dither Rate**

CRSEL	CLKIN RANGE (MHz)	DITHER RATE
0	66 to 134	$f_{IN}/832$
Float	33 to 80	
1	20 to 38	

**Spread-Spectrum Enable**

On power-up, the output clock (SSO) remains three-stated until the internal PLL reaches a stable frequency. The  $\overline{\text{SSEN}}$  input can be used to disable the spread-spectrum modulation and to three-state the SSO output. If the  $\overline{\text{SSEN}}$  pin is pulled high, the spread-spectrum modulation is turned off, but the device still uses the internal PLL to generate the clock signal at SSO. If the  $\overline{\text{SSEN}}$  pin is floated, the output is three-stated.

**Applications Information**

**Power-Supply Decoupling**

To achieve best results, it is highly recommended that a decoupling capacitor is used on the IC power-supply pins. Typical values of decoupling capacitors are 0.01 $\mu\text{F}$  and 0.1 $\mu\text{F}$ . Use a high-quality, ceramic, surface-mount capacitor, and mount it as close as possible to the  $V_{\text{CC}}$  and GND pins of the IC to minimize lead inductance.
