

Features

- Output voltage 5 V \pm 2%
- Ultra low current consumption: typ. 20 μ A
- 300 mA current capability
- Reset Feature
- Very low-drop voltage
- Short-circuit-proof
- Suitable for use in automotive electronics

Functional Description

The TLE 7270 is a monolithic integrated low-drop voltage regulator which can supply loads up to 300 mA. An input voltage up to 42 V is regulated to $V_{Q,nom} = 5.0$ V with a precision of \pm 2%. Due to its integrated reset circuitry featuring a 2-step adjustable power on timing and output voltage monitoring the IC is well suited as μ -controller supply. The sophisticated design allows to achieve stable operation even with ceramic output capacitors down to 470 nF. The device is designed for the harsh environment of automotive applications. Therefore it is protected against overload, short circuit and overtemperature conditions. Of course the TLE 7270 can be used also in all other applications, where a stabilized 5 V voltage is required. Due to its ultra low current consumption the TLE 7270 is dedicated for use in applications permanently connected to V_{BAT} . An integrated output sink current circuitry keeps the voltage at the Output pin Q below 5.5 V even when reverse currents are applied. Thus connected devices are protected from overvoltage damage. For applications requiring extremely low noise levels the Infineon voltage regulator family TLE 42XY and TLE 44XY is more suited than the TLE 7270. A mV-range output noise on the TLE 7270 caused by the charge pump operation is unavoidable due to the ultra low quiescent current concept.

Type	Ordering Code	Package
TLE 7270 D	Q67006-A9670	P-TO252-5-1
TLE 7270 G	Q67006-A9726	P-TO263-5-1

Reset

The Reset pin informs e.g. the microcontroller in case the output voltage has fallen below the lower threshold V_{RT} of typ. 4.65 V. The hysteresis is typically 100mV. Connecting the regulator to a battery voltage at first the reset signal remains LOW. When the output voltage has reached the reset threshold V_{RT} the reset output RO remains still LOW for the reset delay time t_{rd} adjustable in 2 steps via the DT Pin. Afterwards the reset output turns HIGH.

Figure 1 Block Diagram

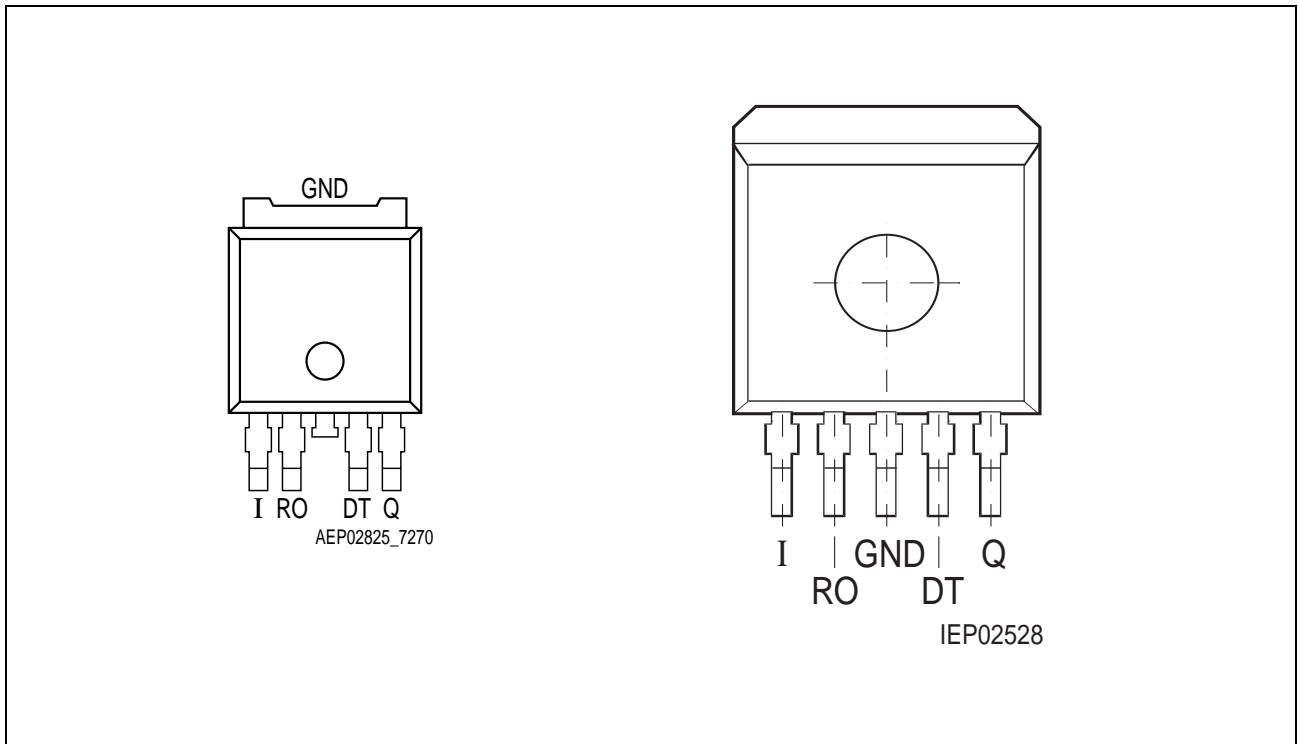

Figure 2 Pin Configuration P-TO252-5-1 (D-PAK), P-TO263-5-1 (D²-PAK) (top view)

Table 1 Pin Definitions and Functions

Pin No.	Symbol	Function
1	I	Input ; block to ground directly at the IC with a ceramic capacitor.
2	RO	Reset Output . Open Collector Output with integrated pull-up resistor of typically 30kΩ. Optional external pull-up resistor of $\geq 10 \text{ k}\Omega$ to pin Q.
3	GND	Ground ; Pin 3 internally connected to heatsink.
4	DT	Delay Time ; connect to Q or GND to choose reset delay time.
5	Q	Output ; block to ground with a ceramic capacitor, $C \geq 470 \text{ nF}$.

Table 2 Absolute Maximum Ratings

Parameter	Symbol	Limit Values		Unit	Test Condition
		Min.	Max.		
Input I					
Voltage	V_I	-0.3	45	V	–
Current	I_I	-1	–	mA	–
Output Q					
Voltage	V_Q	-0.3	5.5	V	–
Voltage	V_Q	-0.3	6.2	V	$t < 10 \text{ s}^1$)
Current	I_Q	-1	–	mA	–
Reset Output RO					
Voltage	V_{RO}	-0.3	5.5	V	–
Voltage	V_{RO}	-0.3	6.2	V	$t < 10 \text{ s}^1$)
Current	I_{RO}	-1	1	mA	–
Delay Time DT					
Voltage	V_{DT}	-0.3	5.5	V	–
Voltage	V_{DT}	-0.3	6.2	V	$t < 10 \text{ s}^1$)
Current	I_{DT}	-1	1	mA	–
Temperature					
Junction temperature	T_j	-40	150	°C	–
Storage temperature	T_{stg}	-50	150	°C	–

1) Exposure to these absolute maximum ratings for extended periods ($t > 10 \text{ s}$) may affect device reliability.

Note: Stresses above those listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 3 Operating Range

Parameter	Symbol	Limit Values		Unit	Remarks
		Min.	Max.		
Input voltage	V_I	5.5	42	V	–
Junction temperature	T_j	-40	150	°C	–

Note: In the operating range, the functions given in the circuit description are fulfilled.

Table 4 Thermal Resistance

External reset pull up resistor	$R_{\text{R,ext}}$	10		∞ 2)	$\text{k}\Omega$	see Fig. 3

Parameter	Symbol	Limit Values			Unit	Measuring Condition
		Min.	Typ.	Max.		
Reset delay time	t_{rd}	10	16	22	ms	DT connected to GND
Reset delay time	t_{rd}	80	128	176	ms	DT connected to Q
Reset reaction time	t_{rr}	–	–	12	μ s	–

- 1) Measured when the output voltage V_Q has dropped 100 mV from the nominal value obtained at $V_I = 13.5$ V.
- 2) An external reset pull up resistor is not required.

Application Information

Figure 3 Application Diagram

Input, Output

An input capacitor is necessary for damping line influences. A resistor of approx. 1 Ω in series with C_i , can damp the LC of the input inductivity and the input capacitor.

The TLE 7270 requires a ceramic output capacitor of at least 470 nF to assure stability of the regulation loop. In order to damp influences resulting from load current surges it is recommended to add an additional electrolytic capacitor of 4.7 μF to 47 μF at the output as shown in **Figure 3**.

Additionally a buffer capacitor C_B of $> 10\mu\text{F}$ should be used for the output to suppress influences from load surges to the voltage levels. This one can either be an aluminum electrolytic capacitor or a tantalum capacitor following the application requirements.

A general recommendation is to keep the drop over the equivalent serial resistor (ESR) together with the discharge of the blocking capacitor below the Reset Headroom (e.g. typ. $V_{RH} = 350\text{mV}$).

Since the regulator output current roughly rises linearly with time the discharge of the capacitor can be calculated as follows:

$$dV_{C_B} = dI_Q \cdot dt / C_B$$

The drop across the ESR calculates as:

$$dV_{ESR} = dI \cdot ESR$$

To prevent a reset the following relationship must be fulfilled:

$$dV_C + dV_{ESR} < V_{RH} = 350\text{mV}$$

Example: Assuming a load current change of $dI_Q = 100\text{mA}$, a blocking capacitor of $C_Q = 22\mu\text{F}$ and a typical regulator reaction time under normal operating conditions of $dt \sim 25\mu\text{s}$ and for special dynamic load conditions, such as load step from very low base load, a reaction time of $dt \sim 75\mu\text{s}$.

$$dV_C = dI_Q \cdot dt / C_B = 100\text{mA} \cdot 25\mu\text{s} / 22\mu\text{F} = 113\text{mV}$$

So for the ESR we can allow

$$dV_{ESR} = V_{RH2} - dV_C = 350\text{mV} - 113\text{mV} = 236\text{mV}$$

The permissible ESR becomes:

$$ESR = dV_{ESR} / dI_Q = 236\text{mV} / 100\text{mA} = 2.36\Omega$$

During design-in of the TLE7469 product family, special care needs to be taken with regards to the regulators reaction time to sudden load current changes starting from very low pre-load as well as cyclic load changes. The application note "*TLE7x Voltage Regulators - Application Note about Transient Response at ultra low quiescent current Voltage Regulators*" (see 3_cip05405.pdf) gives important hints for successful design-in of the Voltage Regulators of the TLE7x family.

Typical Performance Characteristics
