DESCRIPTION

The DG2031 is a sub 1-Ω (0.75 Ω @ 2.7 V) dual SPDT analog switch designed for low voltage applications.

The DG2031 has on-resistance matching (less than 0.05 Ω @ 2.7 V) and flatness (less than 0.2 Ω @ 2.7 V) that are guaranteed over the entire voltage range. Additionally, low logic thresholds makes the DG2031 an ideal interface to low voltage DSP control signals.

The DG2031 has fast switching speed (on/off time @ 34 and 24 ns) with break-before-make guaranteed. In the On condition, all switching elements conduct equally in both directions. Off-isolation and crosstalk is –71 dB @ 100 kHz.

The DG2031 is built on Vishay Siliconix's high-density low voltage CMOS process. An eptiaxial layer is built in to prevent latchup. The DG2031 contains the additional benefit of 2,000-V ESD protection.

Packaged in space saving MSOP-10, the DG2031 is a high performance, low r_{ON} switch for battery powered applications. The DG2031 is available in both standard and lead (Pb)-free packaging. No lead is used in the manufacturing process, for the lead (Pb)-free version, either inside the device/package or on external terminations.

b. All leads welded or soldered to PC Board.
c. Derate 4.0 mW/°C above 70°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
