

# Two output ultra-low additive phase noise PCIe Gen 1 to 5, and UPI/QPI fanout buffer

## Features

- One differential input which accepts any differential format.
- Two differential HCSL outputs
- Ultra-low additive jitter: 32fs (in 12kHz to 20MHz integration band at 400MHz clock frequency)
- Supports clock frequencies from 0 to 400MHz
- Supports 2.5V or 3.3V power supplies for HCSL outputs
- Embedded Low Drop Out (LDO) Voltage regulator provides superior Power Supply Noise Rejection
- Maximum output to output skew of 50ps
- Individual Output Enable pin for each differential pair
- Transfers Spread-Spectrum without attenuation

## Ordering Information

ZL40262LDG1	20 pin QFN	Trays
ZL40262LDF1	20 pin QFN	Tape and Reel

Package size: 4 x 4 mm  
-40°C to +85°C

## Applications

- PCI Express generation 1/2/3/4/5 clock distribution
- UPI/QPI clock distribution
- Low jitter clock trees
- Logic translation
- Clock and data signal restoration
- High performance microprocessor clock distribution
- Test Equipment

## Pin Descriptions

All device inputs and outputs are HCSL unless described otherwise. The I/O column uses the following symbols: I – input, I<sub>PU</sub> – input with 300kΩ internal pull-up resistor, I<sub>PD</sub> – input with 300kΩ internal pull-down resistor, I<sub>APU</sub> – input with 31kΩ internal pull-up resistor, I<sub>APD</sub> – input with 30kΩ internal pull-down resistor, I<sub>APU/APD</sub> – input biased to VDD/2 with 60kΩ internal pull-up and pull-down resistors (30 kΩ equivalent), O – output, I/O – Input/Output pin, NC-No connect pin, P – power supply pin.

**Table 1 Pin Descriptions**

## Functional Description

The ZL40262 is an ultra-low additive jitter, low power 1 to 2 HCSL fanout buffer.

The device operates from 2.5V+/-5% or 3.3V+/-5% supply. Its operation is guaranteed over the industrial temperature range -40°C to +85°C.

## Clock Inputs

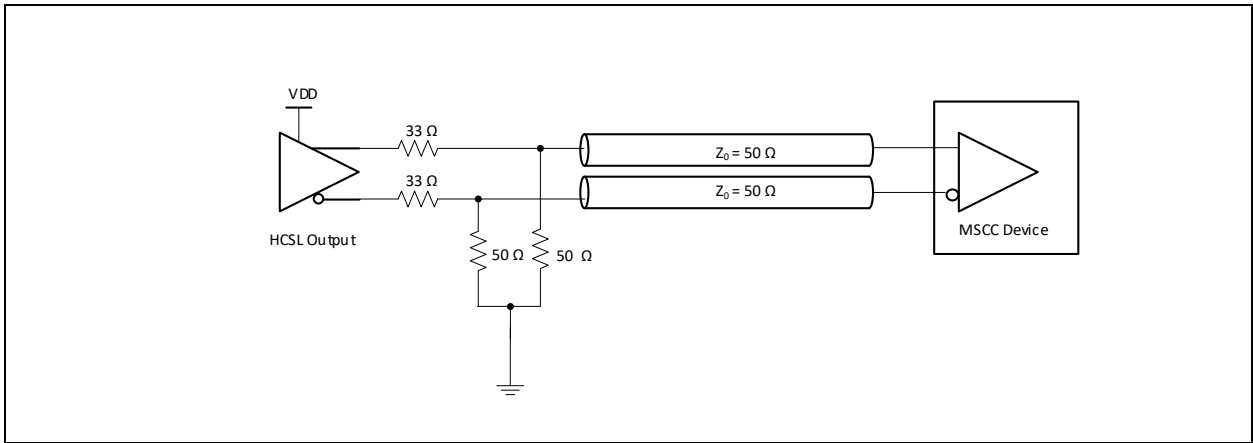

The following blocks diagram shows how to terminate different signals fed to the ZL40262 inputs.

Figure 3 and Figure 4 show how to terminate the input when driven from an HCSL driver.

The input buffer in ZL40262 is a native HCSL receiver so other differential formats need to be AC coupled as shown in Figure 5 and Figure 6 for LVPECL and LVDS signals respectively.

Figure 7 shows how to terminate a single ended output such as LVCMOS. Ideally, resistors R1 and R2 should be 100Ω each and R<sub>o</sub> + R<sub>s</sub> should be 50Ω so that the transmission line is terminated at both ends with characteristic impedance. If the driving strength of the output driver is not sufficient to drive low impedance, the value of series resistor R<sub>s</sub> should be increased. This will reduce the voltage swing at the input but this should be fine as long as the input voltage swing requirement is not violated (Table 5). The source resistors of R<sub>s</sub> = 270Ω could be used for standard LVCMOS driver. This will provide 516mV of voltage swing for 3.3V LVCMOS driver with load current of  $(3.3V/2) * (1/(270\Omega + 50\Omega)) = 5.16mA$ .

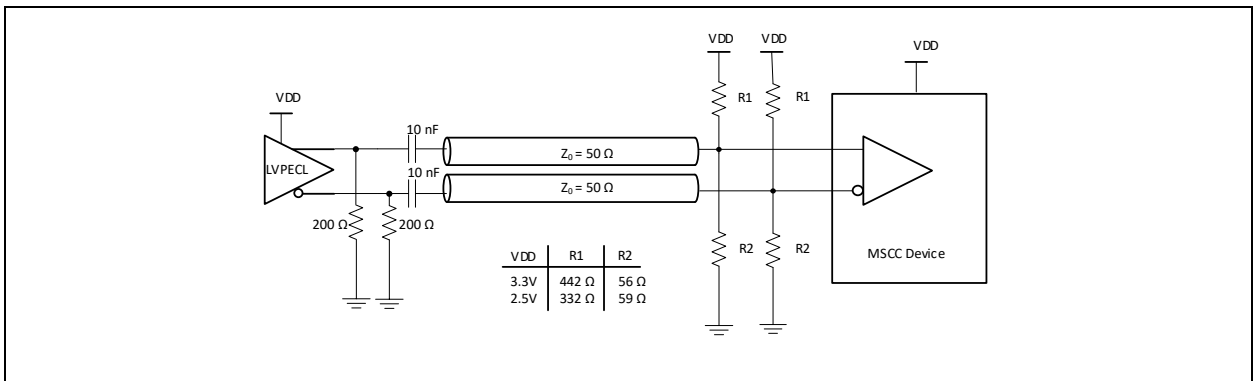

For optimum performance both differential input pins (\_p and \_n) need to be DC biased to the same voltage. Hence, the ratio R1/R2 should be equal to the ratio R3/R4.

**Figure 3. Input driven by source terminated HCSL**

**Figure 4. Input driven by receiver terminated HCSL**

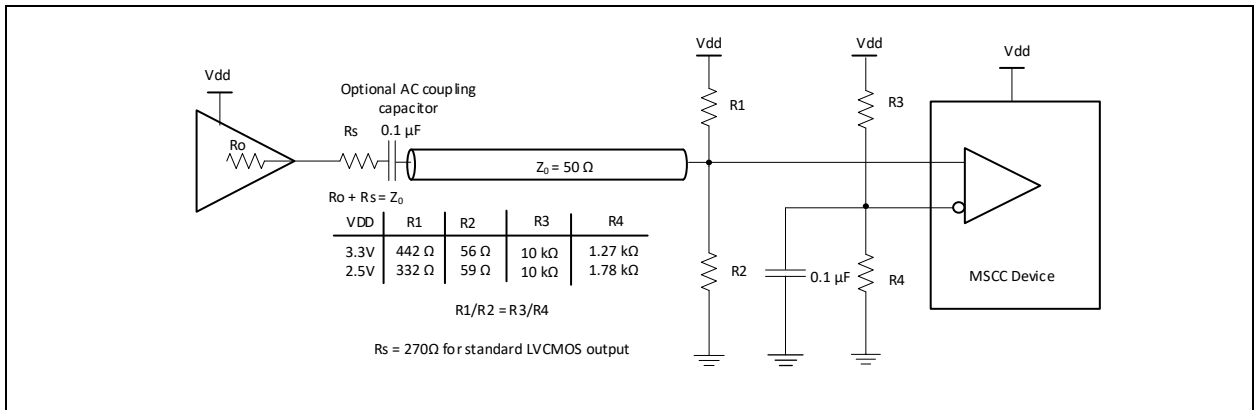

**Figure 5. Input driven by AC coupled LVPECL output**

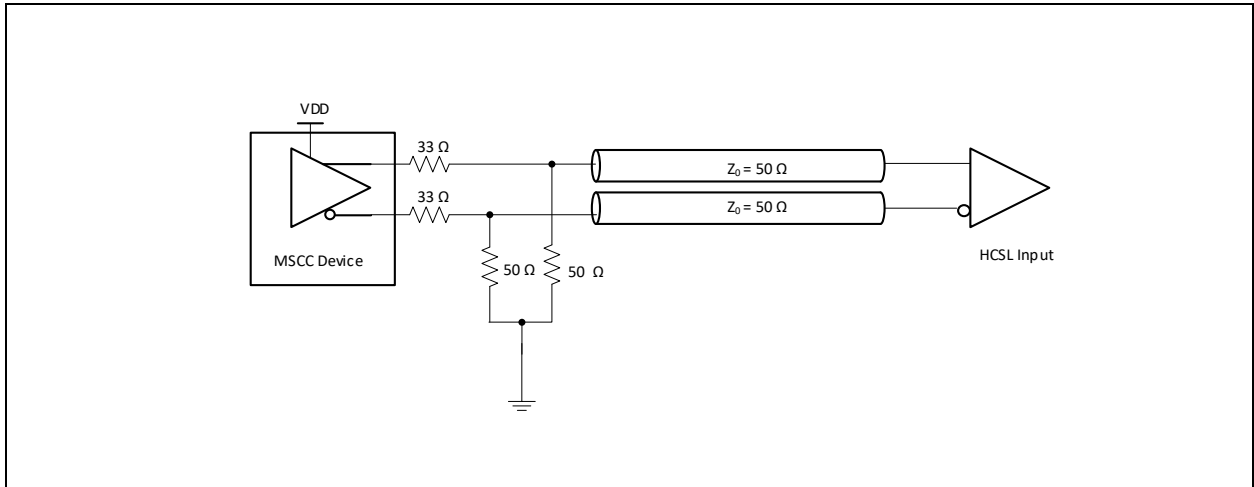

**Figure 6. Input driven by AC coupled LVDS**

**Figure 7. Input driven by a single ended output**

## Clock Outputs

Differential HCSL outputs should be terminated as shown in Figure 8 or Figure 9.

**Figure 8. Source terminated HCSL**

**Figure 9. Receiver terminated HCSL**

### Termination of unused outputs

Unused outputs should be left unconnected.

### Power Consumption

The device total power consumption can be calculated as:

$$P_T = P_S + P_C + P_{O\_DIFF}$$

Where:

$$P_S = V_{DD} * I_S$$

Core power consumed by the input buffer. The static current ( $I_S$ ) is specified in Table 4.

$$P_C = V_{DDO} * I_{DD\_CM}$$

Common output power shared between two outputs. The current  $I_{DD\_CM}$  is specified in Table 4.

$$P_{O\_DIF} = V_{DDO} * I_{DD\_HCSL} * N$$

Output power where output current per output ( $I_{DD\_HCSL}$ ) is specified in Table 4.

N is number of enabled outputs.

Power dissipated inside the device can be calculated by subtracting power dissipated in termination/biasing resistors from the power consumption:

$$P_D = P_T - N * P_{HCSL}$$

Where:

$$P_{HCSL} = (V_{SW} / 50\Omega)^2 * (50\Omega + 33\Omega)$$

$V_{SW}$  is voltage swing of HCSL output.  $50\Omega$  is termination resistance and  $33\Omega$  is series resistance of the HCSL output.

### Power Supply Filtering

Each power pin (VDD and VDDO) should be decoupled with  $0.1\mu\text{F}$  capacitor with minimum equivalent series resistance (ESR) and minimum series inductance (ESL). For example, 0402 X5R Ceramic Capacitors with 6.3V minimum rating could be used. These capacitors should be placed as close as possible to the power pins. To reduce the power noise from adjacent digital components on the board each power supply could optionally be further insulated with low resistance ferrite bead with  $10\mu\text{F}$  and  $1\mu\text{F}$  capacitors. Following figure shows the standard and optional decoupling method.

**Figure 10. Power Supply Filtering**

### Power Supplies and Power-up Sequence

The device has two different power supplies: VDD and VDDO which should always be connected to the same voltage supply. Voltages supported by each of these power supplies are specified in Table 3.

VDD and VDDO should always be turned on and off at the same time.

### Device Control

ZL40262 outputs are controlled via OE[1:0]\_b pins. When an OE\_b pin is low the corresponding outputs will be active and when this pin is high the output will be high-Z. When the output driver is in high-Z mode, the output pins will be pulled low via external 50Ω HCSL termination resistors.

## Typical phase noise performance

The following plots show typical phase noise performance for 100 MHz, 133 MHz and 400 MHz respectively.

Figure 11. 100MHz HCSL Phase Noise

Figure 12. 133MHz HCSL Phase Noise

Figure 13. 400MHz HCSL Phase Noise

## AC and DC Electrical Characteristics

### Absolute Maximum Ratings

**Table 2 Absolute Maximum Ratings\***

	Parameter	Sym.	Min.	Typ.	Max.	Units	Notes
1	Supply voltage (3.3V)	$V_{DD}/V_{DDO}$	-0.5		4.6	V	
2	Supply voltage (2.5V)	$V_{DD}/V_{DDO}$	-0.5		3.5	V	
3	Storage temperature	$T_{ST}$	-55		125	°C	

\* Exceeding these values may cause permanent damage

\* Functional operation under these conditions is not implied

\* Voltages are with respect to ground (GND) unless otherwise stated

### Recommended Operating Conditions

**Table 3 Recommended Operating Conditions\***

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	Supply voltage 3.3V	$V_{DD}/V_{DDO}$	3.135	3.30	3.465	V	
2	Supply voltage 2.5V	$V_{DD}/V_{DDO}$	2.375	2.50	2.625	V	
5	Operating temperature	$T_A$	-40	25	85	°C	
6	Input voltage	$V_{DD-IN}$	-0.3		$V_{DD} + 0.3$	V	

\* Voltages are with respect to ground (GND) unless otherwise stated

\* The device core supports two power supply modes (3.3V and 2.5V)

**Table 4 Current consumption**

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	Core device current	$I_{s\_3.3V}$		49	53	mA	VDD= 3.3V+5%
		$I_{s\_2.5V}$		48	53	mA	VDD = 2.5V+5%
2	Common output current	$I_{DD\_CM\_3.3V}$		5.24	5.82	mA	VDDO= 3.3V+5%
		$I_{DD\_CM\_2.5V}$		4.72	5.32	mA	VDDO= 2.5V+5%
3	Current dissipation per HCSL output	$I_{DD\_HCSL\_3.3V}$		14.92	17.18	mA	VDDO= 3.3V+5%
		$I_{DD\_HCSL\_2.5V}$		14.61	16.62	mA	VDDO= 2.5V+5%

**Table 5 Input Characteristics\***

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1a	CMOS high-level input voltage for control inputs	$V_{CH\_3.3V}$	$0.7 * V_{DD}$			V	$V_{DD} = 3.3V$
1b	CMOS high-level input voltage for control inputs	$V_{CH\_2.5V}$	$0.8 * V_{DD}$			V	$V_{DD} = 2.5V$
2	CMOS low-level input voltage for control inputs	$V_{CIL}$			$0.32 * V_{DD}$	V	
3	CMOS input leakage current for control inputs (includes current due to pull down resistors)	$I_{IL}$	-25		50	$\mu A$	$V_i = V_{DD}$ or 0
4	Differential input common mode voltage for IN_p/n	$V_{CM}$	0.1		0.8	V	
5	Differential input voltage for IN_p/n	$V_{ID}$	0.2		$V_{DD} + 0.3$	V	
6	Differential input leakage current for IN_p/n (includes current due to pull-up and pull-down resistors)	$I_{IL}$	-150		150	$\mu A$	$V_i = 2V$ or 0V
7	Single ended input voltage for IN_p	$V_{SI}$	-0.3		2.7	V	VDD = 3.3V or 2.5V
8	Single ended input common mode voltage IN_p	$V_{SIC}$	0.1		0.8	V	VDD = 3.3V or 2.5V
9	Single ended input voltage swing for IN_p	$V_{SID}$	0.3		1.3	V	VDD = 3.3V or 2.5V
10	Input frequency (differential)	$f_{IN}$	0		400	MHz	
11	Input duty cycle	dc	35%		65%		
13	Input slew rate	slew	0.6	2		V/ns	
14	Input pull-up/ pull-down resistance	$R_{PU}/R_{PD}$		60		k $\Omega$	
15	Input pull-down resistance for IN_p	$R_{PD}$		30		k $\Omega$	
16	Control input (OE_b) pull-down resistance	$R_{PDOE}$		300		k $\Omega$	

\* Values are over Recommended Operating Conditions

\* Values are over all two power supply modes ( $V_{DD} = 3.3V$  and  $V_{DD} = 2.5V$ )

(1) low frequency only

**Table 6 Power Supply Rejection Ratio for VDD = VDDO = 3.3V\***

	Characteristics	Sym.	Min.	Typ.	Max.	Units	Notes
1	PSRR for HCSL output	$PSRR_{HCSL}$		-80.7		dBc	$f_{IN} = 100$ MHz
				-76.4			$f_{IN} = 133$ MHz
				-66.5			$f_{IN} = 400$ MHz

\* Values are over Recommended Operating Conditions

\* Noise injected to VDD/VDDO power supply with frequency 100 kHz and amplitude 100 mVpp

\* PSRR is measured as amplitude of 100 kHz spur in dBc on the output clock phase noise plot

\* Values are over Recommended Operating Conditions

(1) Measurement taken from single ended waveform

(2) Measurement taken from differential waveform.

(3) Measured from -150 mV to +150 mV on the differential waveform (derived from CK minus CK#) The signal must be monotonic through the measurement region for rise and fall time. The 300 mV measurement window is centered on the differential zero crossing. See Figure 17

(4) Measured at crossing point where the instantaneous voltage value of the rising edge of CK equals the falling edge of CK# . See Figure 14

(5) Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement. See Figure 14.

(6) This requirement, from PCI Express Base Specification, Revision 4.0 is applicable only to clock generators and not to buffers. A clock buffer is a transparent device whose output clock period follows the input clock period.

(7) Defined as the maximum instantaneous voltage including overshoot. See Figure 14.

(8) Defined as the minimum instantaneous voltage including undershoot. See Figure 14.

(9) Defined as the total variation of all crossing voltages of Rising CK and Falling CK# This is the maximum allowed variance in VCROSS for any particular system. See Figure 15.

(10) The PPM requirement from PCIe Express Base Specification, Revision 4.0 is related to clock generation devices. This requirement is not applicable to buffers because buffer's output frequency accuracy is identical to the frequency accuracy of the source driving the buffer.

(11) T<sub>STABLE</sub> is the time the differential clock must maintain a minimum ±150 mV differential voltage after 20 rising/falling edges before it is allowed to droop back into the V<sub>RB</sub> ±100 mV differential range. See Figure 18.

(12) Matching applies to rising edge rate for CK<sub>x</sub> and falling edge rate for CK#<sub>x</sub>. It is measured using a ±75 mV window centered on the median cross point where CK<sub>x</sub> rising meets CK#<sub>x</sub> falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations. The Rise Edge Rate of CK<sub>x</sub> should be compared to the Fall Edge Rate of CK#<sub>x</sub> the maximum allowed difference should not exceed 20% of the slowest edge rate. See Figure 16.

(13) Clock DC impedance tolerance depends only on the tolerance of external 50Ω shunt resistors used in HCSL. The test used resistors with +/-1% tolerance.

**Table 9 HCSL (PCIe) Jitter Performance for VDDO = 3.3V**

	Parameter	Sym.	Min.	Typ.	Max.	Units	Notes
1	Additive Jitter as per PCIe 1.0 (1.5MHz to 22MHz)	$T_{jPCIe\_1.0}$		1.2	1.45	ps pk-pk	Input clock: 100 MHz

19	Output to output skew	t <sub>OOSK</sub>			50	ps	
20	Device to device output skew	t <sub>DOOSK</sub>			129	ps	
21	Input to output delay	t <sub>IOD</sub>	0.75	0.85	1	ns	
22	Output enable time	t <sub>EN</sub>			3	cycles	
23	Output disable time	t <sub>DIS</sub>			3	cycles	

\* Values are over Recommended Operating Conditions

(1) Measurement taken from single ended waveform

(2) Measurement taken from differential waveform.

(3) Measured from -150 mV to +150 mV on the differential waveform (derived from CK minus CK#) The signal must be monotonic through the measurement region for rise and fall time. The 300 mV measurement window is centered on the differential zero crossing. See Figure 17

(4) Measured at crossing point where the instantaneous voltage value of the rising edge of CK equals the falling edge of CK# . See Figure 14

(5) Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement. See Figure 14.

(6) This requirement, from PCI Express Base Specification, Revision 4.0 is applicable only to clock generators and not to buffers. A clock buffer is a transparent device whose output clock period follows the input clock period.

(7) Defined as the maximum instantaneous voltage including overshoot. See Figure 14.

(8) Defined as the minimum instantaneous voltage including undershoot. See Figure 14.

(9) Defined as the total variation of all crossing voltages of Rising CK and Falling CK# This is the maximum allowed variance in VCROSS for any particular system. See Figure 15.

(10) The PPM requirement from PCIe Express Base Specification, Revision 4.0 is related to clock generation devices. This requirement is not applicable to buffers because buffer's output frequency accuracy is identical to the frequency accuracy of the source driving the buffer.

(11) TSTABLE is the time the differential clock must maintain a minimum ±150 mV differential voltage after 20 rising/falling edges before it is allowed to droop back into the V<sub>RB</sub> ±100 mV differential range. See Figure 18.

(12) Matching applies to rising edge rate for CKx and falling edge rate for CK#x. It is measured using a ±75 mV window centered on the median cross point where CKx rising meets CK#x falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations. The Rise Edge Rate of CKx should be compared to the Fall Edge Rate of CK#x the maximum allowed difference should not exceed 20% of the slowest edge rate. See Figure 16.

(13) Clock DC impedance tolerance depends only on the tolerance of external 50Ω shunt resistors used in HCSL. The test used resistors with +/-1% tolerance.

**Table 11 HCSL (PCIe) Jitter Performance for VDDO = 2.5V**

	Parameter	Sym.	Min.	Typ.	Max.	Units	Notes
1	Additive Jitter as per PCIe 1.0 (1.5MHz to 22MHz)	T <sub>JPCIe_1.0</sub>		1.03	1.27	ps pk-pk	Input clock: 100MHz
2	Additive Jitter as per PCIe 2.0 high band (1.5MHz to 50MHz)	T <sub>JPCIe_2.0_high</sub>		115	143	fs RMS	Input clock: 100MHz
3	Additive Jitter as per PCIe 2.0 low band (10kHz to 1.5MHz)	T <sub>JPCIe_2.0_low</sub>		28	46	fs RMS	Input clock: 100MHz
4	Additive Jitter as per PCIe 2.0 mid band (5MHz to 16MHz)	T <sub>JPCIe_2.0_mid</sub>		91	113	fs RMS	Input clock: 100MHz
5	Additive Jitter as per PCIe 3.0 (PLL_BW = 2 to 5MHz, CDR = 10MHz)	T <sub>JPCIe_3.0</sub>		29	36	fs RMS	Input clock: 100MHz
6	Additive Jitter as per PCIe 4.0 (PLL_BW = 2 to 5MHz, CDR = 10MHz)	T <sub>JPCIe_4.0</sub>		29	36	fs RMS	Input clock: 100MHz
7	Additive Jitter as per PCIe 5.0 (PLL_BW = 0.5 to 1.8MHz, CDR for 32 GT/s CC)	T <sub>JPCIe_4.0</sub>		11	14	fs RMS	Input clock: 100MHz
8	Additive jitter as per Intel QPI 9.6Gbps	T <sub>JQPI</sub>		53	67	fs RMS	Input clock: 100MHz
9	Additive RMS jitter in 1MHz to 20MHz band	T <sub>J_1M_20M</sub>		75	94	fs RMS	Input clock: 100 MHz
				51	64	fs RMS	Input clock: 133 MHz
				26	33	fs RMS	Input clock: 400 MHz
10	Additive RMS jitter in 12kHz to 20MHz band	T <sub>J_12K_20M</sub>		79	99	fs RMS	Input clock: 100 MHz
				55	68	fs RMS	Input clock: 133 MHz
				32	47	fs RMS	Input clock: 400 MHz
11	Noise floor	N <sub>F</sub>		-162	-159	dBc/Hz	Input clock: 100 MHz
				-163	-161	dBc/Hz	Input clock: 133 MHz
				-160	-158	dBc/Hz	Input clock: 400 MHz

**Figure 19. Test Circuit**

**Table 12 4x4mm QFN Package Thermal Properties**

Parameter	Symbol	Conditions	Value	Units
Maximum Ambient Temperature	$T_A$		85	°C
Maximum Junction Temperature	$T_{JMAX}$		125	°C
Junction to Ambient Thermal Resistance <sup>(1)</sup>	$\theta_{JA}$	still air	34	°C/W
		1m/s airflow	28.9	
		2.5m/s airflow	27.0	
Junction to Board Thermal Resistance	$\theta_{JB}$		15.4	°C/W
Junction to Case Thermal Resistance	$\theta_{JC}$		25.9	°C/W
Junction to Pad Thermal Resistance <sup>(2)</sup>	$\theta_{JP}$	Still air	8.1	°C/W
Junction to Top-Center Thermal Characterization Parameter	$\Psi_{JT}$	Still air	1.0	°C/W

- (1) Theta-JA ( $\theta_{JA}$ ) is the thermal resistance from junction to ambient when the package is mounted on a 4-layer JEDEC standard test board and dissipating maximum power
- (2) Theta-JP ( $\theta_{JP}$ ) is the thermal resistance from junction to the center exposed pad on the bottom of the package)

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, California, and has approximately 4,800 employees globally. Learn more at [www.microsemi.com](http://www.microsemi.com).

Microsemi makes no warranty, representation, or guarantee regarding the information contained herein or the suitability of its products and services for any particular purpose, nor does Microsemi assume any liability whatsoever arising out of the application or use of any product or circuit. The products sold hereunder and any other products sold by Microsemi have been subject to limited testing and should not be used in conjunction with mission-critical equipment or applications. Any performance specifications are believed to be reliable but are not verified, and Buyer must conduct and complete all performance and other testing of the products, alone and together with, or installed in, any end-products. Buyer shall not rely on any data and performance specifications or parameters provided by Microsemi. It is the Buyer's responsibility to independently determine suitability of any products and to test and verify the same. The information provided by Microsemi hereunder is provided "as is, where is" and with all faults, and the entire risk associated with such information is entirely with the Buyer.
