DG411, DG412, DG413

Monolithic Quad SPST, CMOS Analog Switches

August 1997

Features

- **ON-Resistance** .... $<35\Omega$ **Max**
- **Low Power Consumption (P_D)** .... $<35\mu W$
- **Fast Switching Action**
  - t_{ON} .... $<175ns$
  - t_{OFF} .... $<145ns$
- **Low Charge Injection**
- **Upgrade from DG211/DG212**
- **TTL, CMOS Compatible**
- **Single or Split Supply Operation**

Applications

- **Audio Switching**
- **Battery Operated Systems**
- **Data Acquisition**
- **Hi-Rel Systems**
- **Sample and Hold Circuits**
- **Communication Systems**
- **Automatic Test Equipment**

Description

The DG411 series monolithic CMOS analog switches are drop-in replacements for the popular DG211 and DG212 series devices. They include four independent single pole throw (SPST) analog switches, and TTL and CMOS compatible digital inputs.

These switches feature lower analog ON resistance ($<35\Omega$) and faster switch time ($t_{ON} < 175ns$) compared to the DG211 or DG212. Charge injection has been reduced, simplifying sample and hold applications.

The improvements in the DG411 series are made possible by using a high voltage silicon-gate process. An epitaxial layer prevents the latch-up associated with older CMOS technologies. The 44V maximum voltage range permits controlling $40V_{P-P}$ signals. Power supplies may be single-ended from +5V to +34V, or split from ±5V to ±20V.

The four switches are bilateral, equally matched for AC or bidirectional signals. The ON resistance variation with analog signals is quite low over a 15V analog input range. The switches in the DG411 and DG412 are identical, differing only in the polarity of the selection logic. Two of the switches in the DG413 (#1 and #4) use the logic of the DG211 and DG411 (i.e., a logic "0" turns the switch ON) and the other two switches use DG212 and DG412 positive logic. This permits independent control of turn-on and turn-off times for SPDT configurations, permitting "break-before-make" or "make-before-break" operation with a minimum of external logic.

GND to V-.. 25V
V_L .... (GND -0.3V) to (V+) +0.3V
Digital Inputs, V_S, V_D (Note 1) ..... (V-) -2V to (V+) + 2V or 30mA,
Whichever Occurs First
Continuous Current (Any Terminal) 30mA
Current, S or D (Pulsed 1ms, 10% Duty Cycle) 100mA

Operating Conditions

Operating Voltage Range......................... ±20V (Max)
Operating Temperature Range.................. -40°C to 85°C
Input Low Voltage.............................0.8V (Max)
Input High Voltage .... 2.4V (Min)
Input Rise and Fall Time.......................... ≤20ns
Operating Temperature
(D Suffix)................................-40°C to 85°C

Thermal Information

Thermal Resistance (Typical, Note 2) θ_{JA} (°C/W) θ_{JC} (°C/W)
PDIP Package   100   N/A
SOIC Package   115   N/A
CERDIP Package   75   20
Maximum Junction Temperature (Plastic Packages)........150°C
Maximum Junction Temperature (Ceramic Package) ....175°C
Maximum Storage Temperature Range ....-65°C to 125°C
Maximum Lead Temperature (Soldering 10s).............300°C
(SOIC - Lead Tips Only)

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:
1. Signals on S_X, D_X, or IN_X exceeding V+ or V- will be clamped by internal diodes. Limit forward diode current to maximum current ratings.
2. θ_{JA} is measured with the component mounted on an evaluation PC board in free air.

NOTES:

3. V_{IN} = input voltage to perform proper function.

4. Hot = as determined by the operating temperature suffix.

5. The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.

6. Typical values are for DESIGN AID ONLY, not guaranteed nor subject to production testing.

Test Circuits and Waveforms

V_O is the steady state output with the switch on. Feedthrough via switch capacitance may result in spikes at the leading and trailing edge of the output waveform.

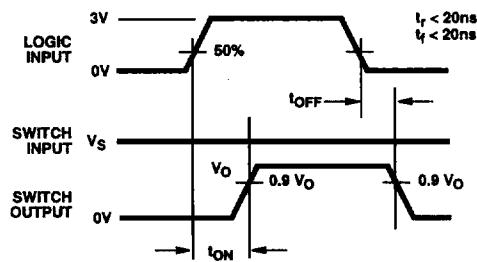

NOTE: Logic input waveform is inverted for switches that have the opposite logic sense.

FIGURE 7A.
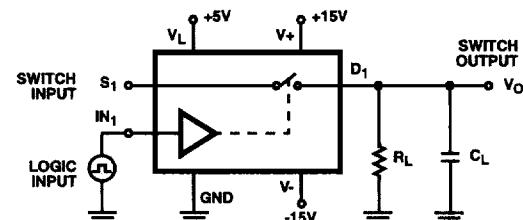

Repeat test for all IN and S.
For load conditions, see Specifications C_L (includes fixture and stray capacitance).

$$V_O = V_S \frac{R_L}{R_L + r_{DS(ON)}}$$

SWITCHES

Typical Applications

Single Supply Operation

The DG411, DG412, DG413 can be operated with unipolar supplies from 5V to 44V. These devices are characterized and tested for unipolar supply operation at 12V to facilitate the majority of applications. To function properly, 12V are tied to Pin 13 and 0V are tied to Pin 4.

NOTE: Pin 12 still requires 5V for TTL compatible switching.

Summing Amplifier

When driving a high impedance, high capacitance load such as shown in Figure 9, where the inputs to the summing amplifier have some noise filtering, it is necessary to have shunt switches for rapid discharge of the filter capacitor, thus preventing offsets from occurring at the output.
