

CY62128V Family

128K x 8 Static RAM

Features

- **Low voltage range:**
 - 2.7V–3.6V (CY62128V)
 - 2.3V–2.7V (CY62128V25)
 - 1.6V–2.0V (CY62128V18)
- **Low active power and standby power**
- **Easy memory expansion with CE and OE features**
- **TTL-compatible inputs and outputs**
- **Automatic power-down when deselected**
- **CMOS for optimum speed/power**

Functional Description

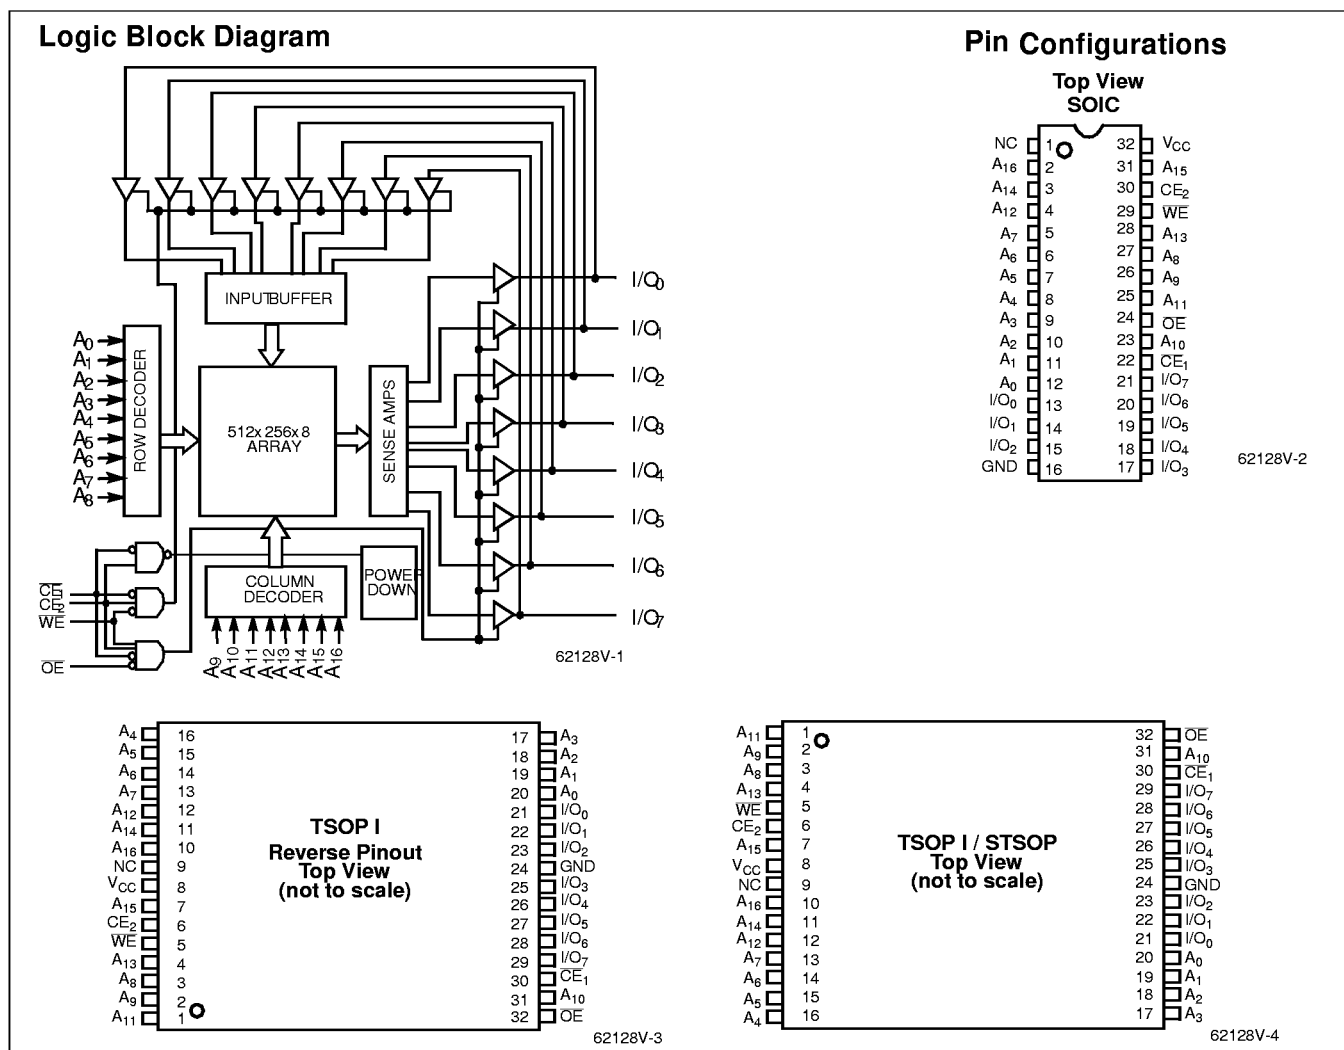

The CY62128V family is composed of three high-performance CMOS static RAMs organized as 131,072 words by 8 bits. Easy memory expansion is provided by an active LOW chip enable (\overline{CE}) and active LOW output enable (\overline{OE}) and

three-state drivers. These devices have an automatic power-down feature, reducing the power consumption by over 99% when deselected. The CY62128V family is available in the standard 450-mil-wide SOIC, TSOP, and STSOP packages.

Writing to the device is accomplished by taking chip enable one (\overline{CE}_1) and write enable (WE) inputs LOW and the chip enable two (\overline{CE}_2) input HIGH. Data on the eight I/O pins (I/O₀ through I/O₇) is then written into the location specified on the address pins (A₀ through A₁₆).

Reading from the device is accomplished by taking chip enable one (\overline{CE}_1) and output enable (\overline{OE}) LOW while forcing write enable (WE) and chip enable two (\overline{CE}_2) HIGH. Under these conditions, the contents of the memory location specified by the address pins will appear on the I/O pins.

The eight input/output pins (I/O₀ through I/O₇) are placed in a high-impedance state when the device is deselected (\overline{CE}_1 HIGH or \overline{CE}_2 LOW), the outputs are disabled (\overline{OE} HIGH), or during a write operation (\overline{CE}_1 LOW, \overline{CE}_2 HIGH, and WE LOW).

Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

- Storage Temperature -65°C to +150°C
- Ambient Temperature with Power Applied 55°C to +125°C
- Supply Voltage to Ground Potential (Pin 28 to Pin 14) -0.5V to +4.6V
- DC Voltage Applied to Outputs in High Z State^[1] -0.5V to V_{CC} + 0.5V
- DC Input Voltage^[1] -0.5V to V_{CC} + 0.5V

- Output Current into Outputs (LOW) 20 mA
- Static Discharge Voltage >2001V (per MIL-STD-883, Method 3015)
- Latch-Up Current >200 mA

Operating Range

Range	Ambient Temperature	V _{CC}
Commercial	0°C to +70°C	1.6V to 3.6V
Industrial	-40°C to +85°C	1.6V to 3.6V

Product Portfolio

Switching Waveforms

Read Cycle No. 1^[10, 11]

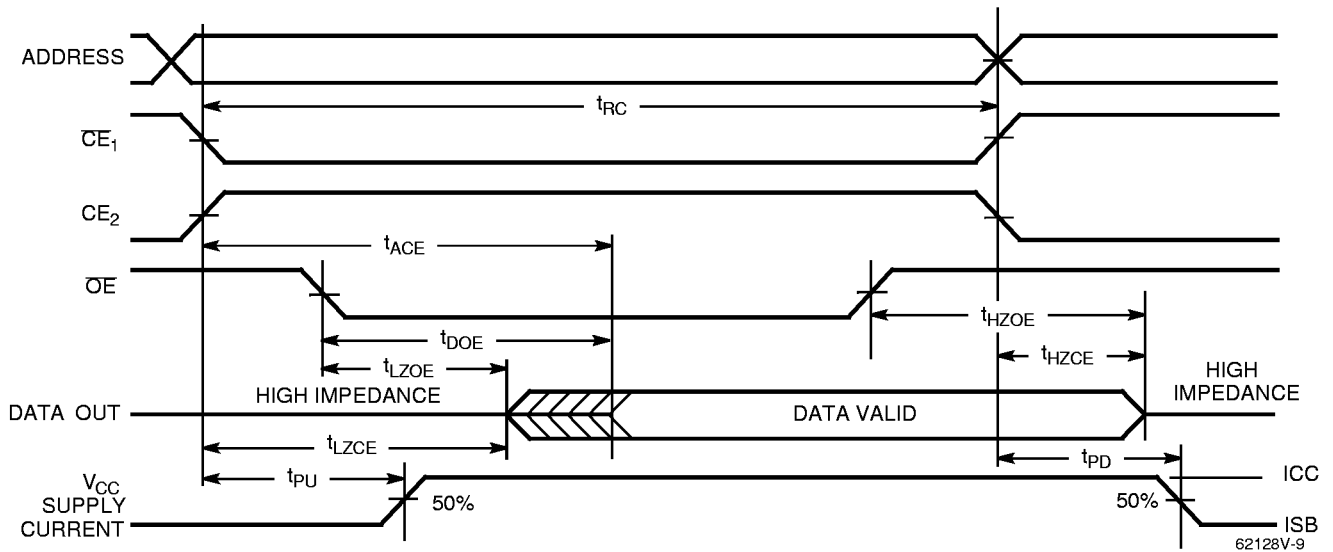

62128V-8

Notes:

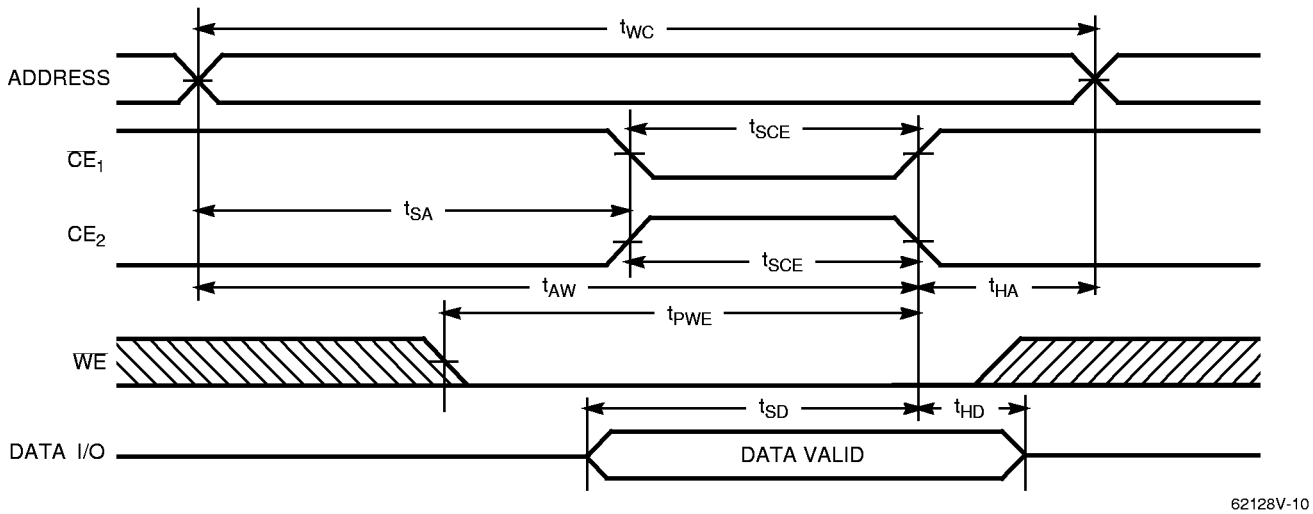

5. Test conditions assume signal transition time of 5 ns or less timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 100-pF load capacitance.
6. At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any given device.
7. t_{HZOE} , t_{HZCE} , and t_{HZWE} are specified with $C_L = 5$ pF as in part (b) of AC Test Loads. Transition is measured ± 200 mV from steady-state voltage.
8. The internal write time of the memory is defined by the overlap of \overline{CE}_1 LOW, \overline{CE}_2 HIGH and \overline{WE} LOW. \overline{CE}_1 and \overline{WE} signals must be LOW and \overline{CE}_2 HIGH to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
9. The minimum write cycle time for write cycle #3 (\overline{WE} controlled, \overline{OE} LOW) is the sum of t_{HZWE} and t_{SD} .
10. Device is continuously selected. \overline{OE} , $\overline{CE} = V_{IL}$, $\overline{CE}_2 = V_{IH}$.
11. \overline{WE} is HIGH for read cycle.

Switching Waveforms (continued)

Read Cycle No. 2 (\overline{OE} Controlled)^[11,12]

Write Cycle No. 1 (\overline{CE}_1 or \overline{CE}_2 Controlled)^[13,14]

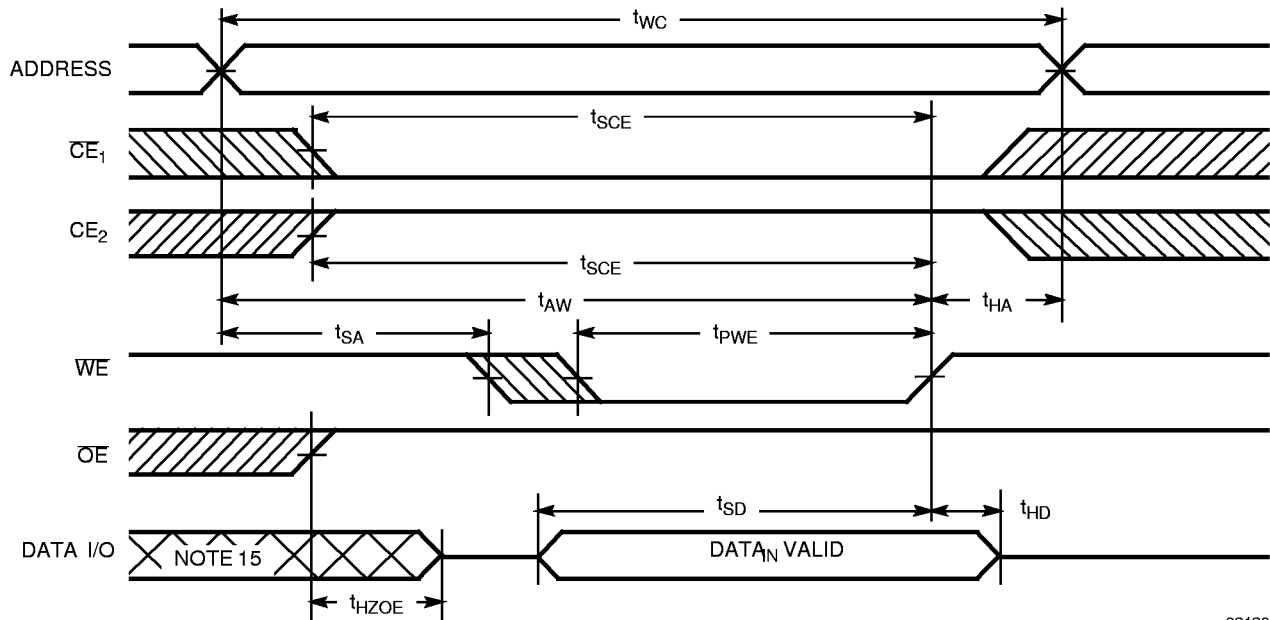

Notes:

12. Address valid prior to or coincident with \overline{CE}_1 transition LOW and \overline{CE}_2 transition HIGH.
13. Data I/O is high impedance if $\overline{OE} = V_{IH}$.
14. If \overline{CE}_1 goes HIGH or \overline{CE}_2 goes LOW simultaneously with \overline{WE} HIGH, the output remains in a high-impedance state.

Switching Waveforms (continued)

Write Cycle No. 2 (WE Controlled, OE HIGH During Write)^[13,14]

62128V-11

Note:

15. During this period, the I/Os are in output state and input signals should not be applied.

Truth Table

CE ₁	CE ₂	OE	WE	I/O ₀ -I/O ₇	Mode	Power
