

### 600 Watts

- 180 - 425 VDC input range
- Single output
- Industry standard full brick
- -40 °C to +100 °C operation
- 3000 VAC isolation
- Output trim -40% to +10%
- Remote on/off
- Current share and power good signals
- 3 year warranty

#### Dimensions:

QHL600:  
4.6 x 2.4 x 0.5" (116.8 x 61.0 x 12.7 mm)

The QHL600 series offers a compact 600W DC-DC solution in an industry standard full brick package. This series of modules enables effective construction of distributed power architectures from AC front ends, PFC front ends and battery systems.

### Application Notes

#### Input Fusing and Safety Considerations

The QHL600 series converters have no internal fuse. In order to achieve maximum safety and system protection, always use an input line fuse. We recommended a 6.3 A fast acting fuse. It is recommended that the circuit has a transient voltage suppressor diode (TVS) across the input terminals to protect the unit against surge or spike voltages and input reverse voltage (as shown). A suitable part would be SMCJ440A.

Suggested Basic Layout

#### Output Voltage Adjustment

The Trim input permits the user to adjust the output voltage up by 10% or down by 40%. This is accomplished by connecting a mandatory external resistor between the Trim pin and negative sense pin of value 6.8kOhm. Then select Ru or Rd to determine desired output voltage.

C1: 220  $\mu$ F, 100 V  
C2: 470  $\mu$ F, 100 V

#### Airflow Derating Graph – Without Heatsink

#### Example (Without Heatsink)

To determine the minimum airflow necessary for a QHL600300S12 operating at an input voltage of 300 V, an output current of 25 A, and a maximum ambient temperature of 40°C:

Determine Power dissipation (Pd):  $Pd = Pi - Po = Po(1-\eta)/\eta,$

$$Pd = 12 V \times 25 A \times (1-0.89)/0.89 = 37.1$$

Where  $Pi$  = Input power,  $Po$  = Output Power and  $\eta$  = Efficiency

Determine airflow from airflow derating graph using data points for  $Pd=33.1$  W and  $Ta = 40$  °C

Minimum airflow= 600 ft./min.

To check that the maximum case temp of 100 °C is not exceeded:

Maximum temperature rise is  
 $\Delta T = Pd \times Rca = 37.1 \times 1.5 = 55.65^\circ C.$

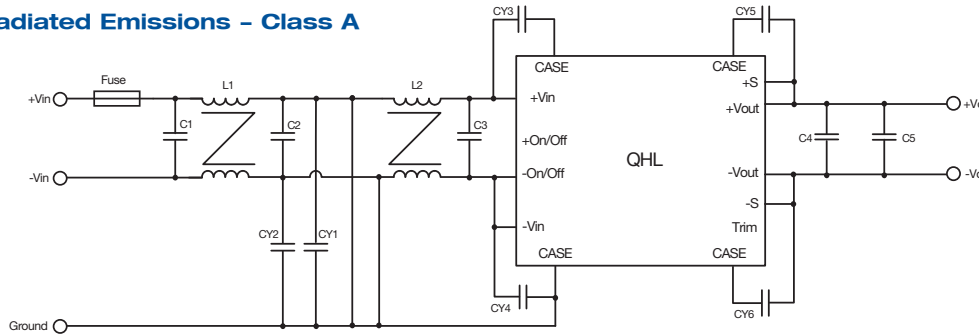

Maximum case temperature is

$$Tc = Ta + \Delta T = 95.65^\circ C < 100^\circ C.$$

Where: Rca is the thermal resistance from case to ambient environment. Ta is ambient temperature and Tc is case temperature.

#### Safety Considerations

The use of a fuse on the input line is recommended for good practice. Additional protection for surges and reverse voltage are also recommended. Transient voltage suppressors and gas discharge devices can be fitted across the input terminals.
