## 3.3 V Xtal or LVTTTL/LVCMOS Input 2:1 MUX to 1:4 LVPECL Fanout Buffer

### Description

The NB3N853531E is a low skew 3.3 V supply 1:4 clock distribution fanout buffer. An input MUX selects either a Fundamental Parallel Mode Crystal or a LVCMOS/LVTTL Clock by using the CLK\_SEL pin (HIGH for Crystal, LOW for Clock) with LVCMOS / LVTTL levels.

The single ended CLK input is translated to four LVPECL Outputs. Using the crystal input, the NB3N853531E can be a Clock Generator. A CLK\_EN pin can enable or disable the outputs synchronously to eliminate runt pulses using LVCMOS/LVTTL levels (HIGH to enable outputs, LOW to disable outputs).

**Figure 6.** For 155.52 MHz Carrier, the NB3N853531E Additive Phase Noise (dBc/Hz) versus SSB Offset Frequency (Hz) Integrated Jitter from 12 kHz to 20 MHz (Upper Heavy Line) is 88.1 fs RMS. The E8663B Source Generator Additive Phase Noise (Lower Light Line) is 70.1 fs RMS. Where  $t_{JIT} = \sqrt{(t_{JIToutput})^2 - (t_{JITinput})^2} = 53$  fs

## Application – Crystal Input Interface

Figure 7 shows the NB3N853531E device crystal oscillator interface using a typical parallel resonant crystal. A parallel crystal with loading capacitance  $C_L = 18$  pF could use Series Load Caps  $C1 = 32$  pF and  $C2 = 32$  pF as nominal values, after subtracting a typical 4 pF of stray cap per line. The frequency accuracy and duty cycle skew can be fine tuned by adjusting the C1 and C2 values. For example, increasing the C1 and C2 values will reduce the operational frequency. Note R1 is optional and may be 0 Ω.

**Figure 7. NB3N853531E Crystal Oscillator Interface**  
 \*R1 is optional. Assuming 4 pF stray cap per pin.
