Attention please!

As far as patents or other rights of third parties are concerned, liability is only assumed for components, not for applications, processes and circuits implemented within components or assemblies.

The information describes the type of component and shall not be considered as assured characteristics.

Terms of delivery and rights to change design reserved.

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies AG is an approved CECC manufacturer.

Packing

Please use the recycling operators known to you. We can also help you – get in touch with your nearest sales office. By agreement we will take packing material back, if it is sorted. You must bear the costs of transport.

For packing material that is returned to us unsorted or which we are not obliged to accept, we shall have to invoice you for any costs incurred.

Components used in life-support devices or systems must be expressly authorized for such purpose!

Critical components[1] of the Infineon Technologies AG, may only be used in life-support devices or systems[2] with the express written approval of the Infineon Technologies AG.

1 A critical component is a component used in a life-support device or system whose failure can reasonably be expected to cause the failure of that life-support device or system, or to affect its safety or effectiveness of that device or system.

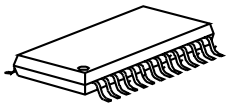
2 Life support devices or systems are intended (a) to be implanted in the human body, or (b) to support and/or maintain and sustain human life. If they fail, it is reasonable to assume that the health of the user may be endangered.

Product Info

General Description

The **TUA6020** is a 5 V mixer/oscillator and synthesizer for analog and digital TV and VCR tuners.

Package



Features

General

- Suitable for analog and digital terrestrial TV tuner
- Full ESD protection

Mixer/Oscillator

- High impedance mixer input for LOW/MID band
- Low impedance mixer input for HIGH band
- 4 pin oscillator for LOW/MID band
- 4 pin oscillator for HIGH band

IF-Amplifier

- balanced SAW preamplifier
- Low output impedance

PLL

- PLL with short lock-in time
- High voltage VCO tuning output
- Fast I^2C bus
- 3 NPN bandswitch buffers
- Internal LOW-MID/HIGH switch
- Lock-in flag
- Power-down reset
- Programmable reference divider ratios: 24, 64, 80, 128
- Programmable charge pump current

Application

- The IC is suitable for PAL tuner in TV- and VCR-sets or set-top receivers for analog TV and **D**igital **V**ideo **B**roadcasting.

2 Product Description

Contents of this Chapter

2.1 General Description

The **TUA6020** device combines a digitally programmable phase locked loop (PLL), with a mixer-oscillator block including two balanced mixers and oscillators for use in TV and VCR tuners.

The PLL block with four selectable chip addresses forms a digitally programmable phase locked loop. With a 4 MHz quartz crystal, the PLL permits precise setting of the frequency of the tuner oscillator up to 1024 MHz in increments of 31.25, 50, 62.5 or 166.7 kHz. The tuning process is controlled by a microprocessor via an I^2C bus. The device has three output ports. A flag is set when the loop is locked. It can be read by the processor via the I^2C bus.

The mixer-oscillator block includes two balanced mixers (one mixer with high-impedance input and one mixer with a balanced low-impedance input), two frequency and amplitude-stable balanced oscillators for LOW/MID and HIGH, an IF amplifier, a low-noise reference voltage source, and a band switch.

2.2 Features

General

- Suitable for analog and digital terrestrial TV tuner
- Full ESD protection

Mixer/Oscillator

- High impedance mixer input for LOW/MID band
- Low impedance mixer input for HIGH band
- 4 pin oscillator for LOW/MID band
- 4 pin oscillator for HIGH band

IF-Amplifier

- balanced SAW preamplifier
- Low output impedance

PLL

- PLL with short lock-in time
- High voltage VCO tuning output
- Fast I^2C bus
- 3 NPN bandswitch buffers
- Internal LOW-MID/HIGH switch
- Lock-in flag
- Power-down reset

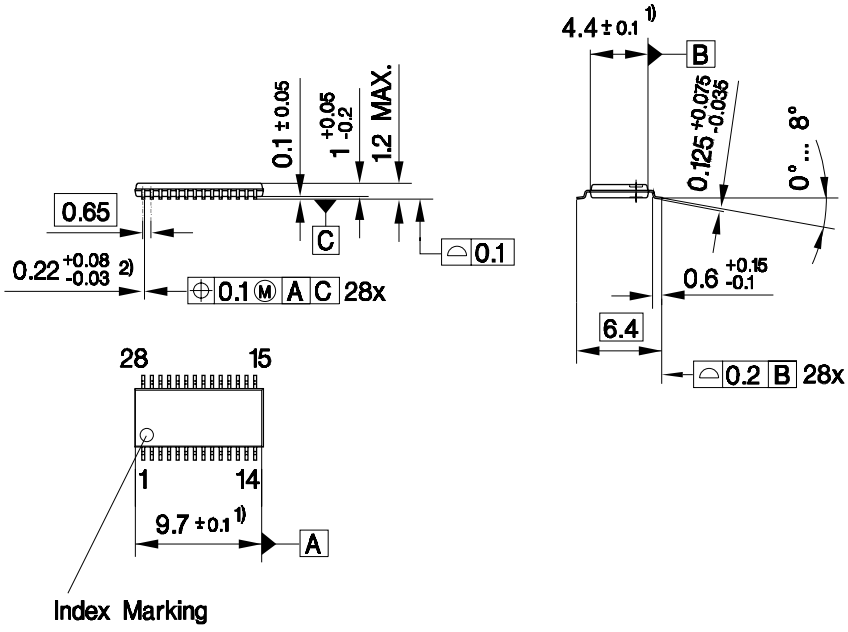
- Programmable reference divider ratios: 24, 64, 80, 128
- Programmable charge pump current

2.3 Application

- The IC is suitable for PAL tuners in TV- and VCR-sets or set-top receivers for analog TV and **D**igital **V**ideo **B**roadcasting.

2.4 Package Outlines

P-TSSOP-28-1



1) Does not include plastic or metal protrusion of 0.15 max. per side
2) Does not include dambar protrusion

3.3 Block Diagram

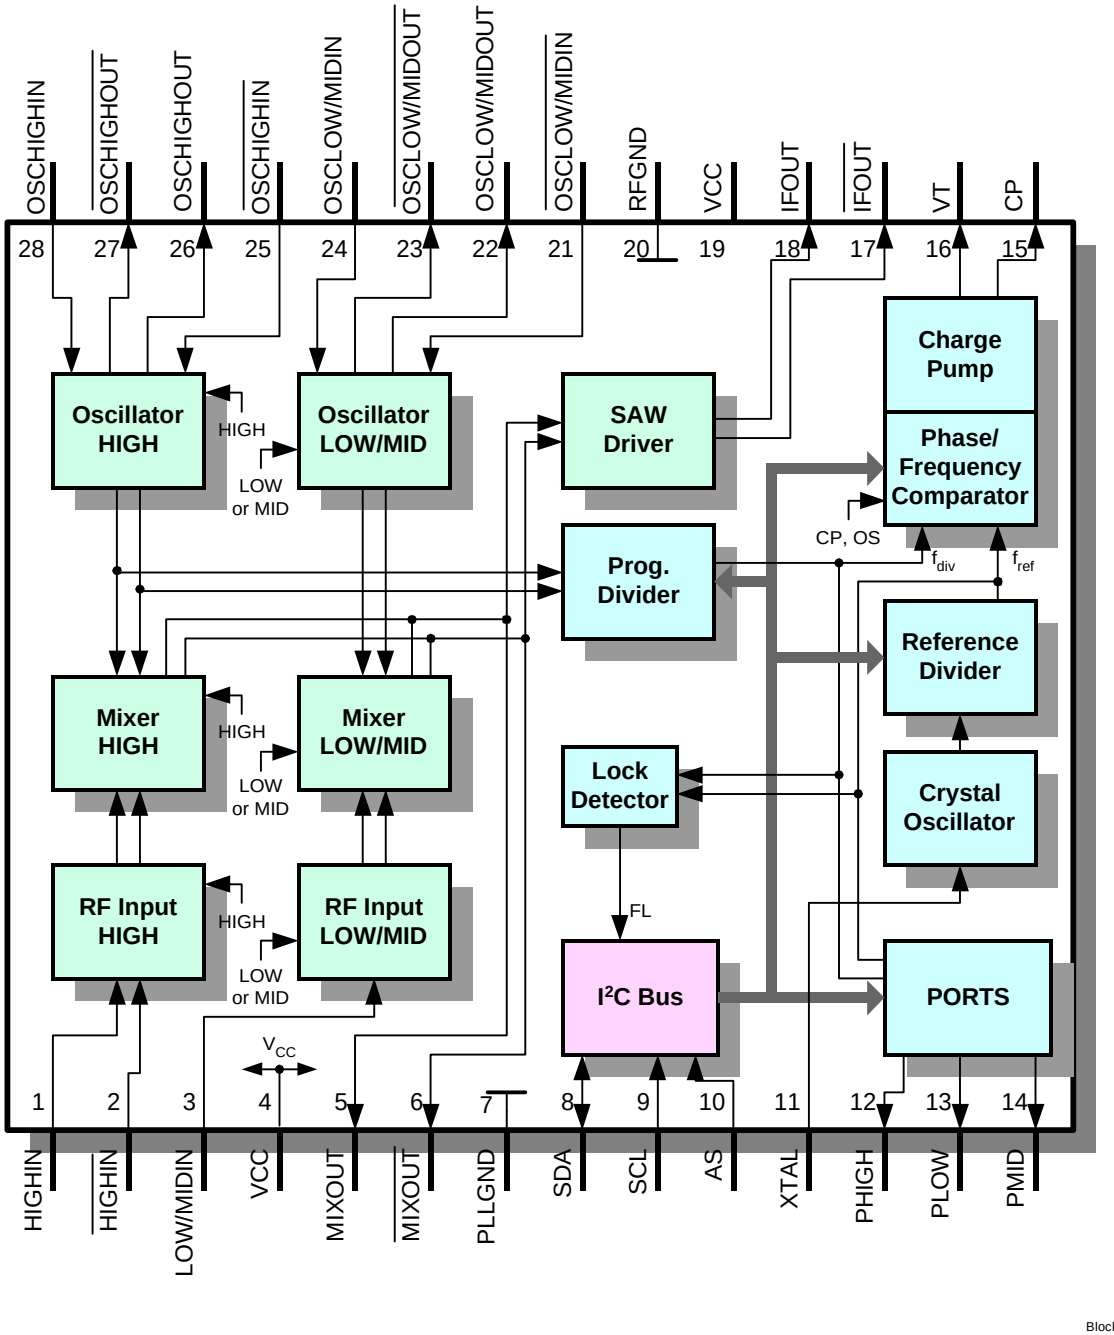

Figure 3-2 Block Diagram

3.4 Circuit Description

3.4.1 Mixer-Oscillator block

The mixer oscillator section includes two balanced mixers (double balanced mixer), two balanced oscillators for LOW/MID and HIGH, an IF amplifier, a reference voltage source and a band switch.

Filters between tuner input and IC separate the TV frequency signals into two bands. The band switching in the tuner front-end is done by using two or three port outputs. In the selected band the signal passes a tuner input stage with MOSFET amplifier, a double-tuned bandpass filter and is then fed to the balanced mixer input of the IC which has in case of LOW / MID a high-impedance input and in case of HIGH a low-impedance input. The input signal is mixed there with the signal from the activated on chip oscillator to the IF frequency which is filtered out at the balanced high-impedance output pair by means of a parallel tuned circuit. The following SAW preamplifier has a low output impedance to drive the SAW filter directly.

3.4.2 PLL block

The oscillator signal is internally DC-coupled as a differential signal to the programmable divider inputs. The signal subsequently passes through a programmable divider with ratio N = 256 through 32767 and is then compared in a digital frequency / phase detector to a reference frequency f_{ref} = 31.25, 50, 62.5 or 166.7 kHz.This frequency is derived from an unbalanced, low-impedance 4 MHz crystal oscillator (pin XTAL) divided by R = 128, 80, 64 or 24.

The phase detector has two outputs that drive two current sources of opposite polarity as charge pump. If the negative edge of the divided VCO signal appears prior to the negative edge of the reference signal, the positive current source pulses for the duration of the phase difference. In the reverse case the I- current source pulses. If the two signals are in phase, the charge pump output (CP) goes into the high-impedance state (PLL is locked). An active low-pass filter integrates the current pulses to generate the tuning voltage for the VCO (internal amplifier, external pull-up resistor at TUNE and external RC circuitry). The charge pump output is also switched into the high-impedance state if the control bits T0 = 1 and T1 = 0. Here it should be noted, however, that the tuning voltage can alter over a long period in the high-impedance state as a result of self-discharge in the peripheral circuitry. TUNE may be switched off by the control bit OS to allow external adjustments.

If the VCO is not oscillating the PLL locks to a tuning voltage of 33V (V_{TH}).

By means of control bit CP the pump current can be switched between two values by software. This programmability permits alteration of the control response time of the PLL in the locked-in state. In this way different VCO gains can be compensated, for example.

The software-switched ports PLOW, PMID and PHIGH are general-purpose open-collector outputs. The test bits T0 = 0 and T1 = 1, switch the test signals fref (i.e.fXTAL / 64) and fdiv (divided input signal) to PMID and PLOW respectively.

The lock detector resets the lock flag FL if the width of the charge pump current pulses is wider than the period of the crystal oscillator (i.e. 250 ns). Hence, if FL = 1, the maximum deviation of the input frequency from the programmed frequency is given by

$$\Delta f = \pm I_P * (K_{VCO} / f_{XTAL}) * (C1+C2) / (C1*C2)$$

where I_P is the charge pump current, K_{VCO} the VCO gain, f_{XTAL} the crystal oscillator frequency and C1, C2 the capacitances in the loop filter (see Figure 4-1 Evaluation board, PAL application on page 2). As the charge pump pulses at i.e. 62.5 kHz (= f_{ref}), it takes a maximum of 16 µs for FL to be reset after the loop has lost lock state.

Once FL has been reset, it is set only if the charge pump pulse width is less than 250 ns for eight consecutive f_{ref} periods. Therefore it takes between 128 and 144 µs for FL to be set after the loop regains lock.

3.4.3 I²C-Bus Interface

Data is exchanged between the processor and the PLL via the I²C bus. The clock is generated by the processor (input SCL), while pin SDA functions as an input or output depending on the direction of the data (open collector, external pull-up resistor). Both inputs have hysteresis and a low-pass characteristic, which enhance the noise immunity of the I²C bus.

The data from the processor pass through an I²C bus controller. Depending on their function the data are subsequently stored in registers. If the bus is free, both lines will be in the marking state (SDA, SCL are HIGH). Each telegram begins with the start condition and ends with the stop condition. Start condition: SDA goes LOW, while SCL remains HIGH. Stop condition: SDA goes HIGH while SCL remains HIGH. All further information transfer takes place during SCL = LOW, and the data is forwarded to the control logic on the positive clock edge.

The table ”Bit Allocation” (see Table 5-4 Bit Allocation Read / Write on page 10) should be referred to the following description. All telegrams are transmitted byte-by-byte, followed by a ninth clock pulse, during which the control logic returns the SDA line to LOW (acknowledge condition). The first byte is comprised of seven address bits. These are used by the processor to select the PLL from several peripheral components (chip select). The LSB bit (R/W) determines whether data are written into (R/W = 0) or read from (R/W = 1) the PLL.

In the data portion of the telegram during a WRITE operation, the MSB bit of the first or third data byte determines whether a divider ratio or control information is to follow. In each case the second byte of the same data type has to follow the first byte.

If the address byte indicates a READ operation, the PLL generates an acknowledge and then shifts out the status byte onto the SDA line. If the processor generates an acknowledge, a further status byte is output; otherwise the data line is released to allow the processor to generate a stop condition. The status word consists the lock flag and the power-on flag.

Four different chip addresses can be set by appropriate DC level at pin AS (see Table 5-6 Address selection on page 11).

While applying the supply voltage, a power-on reset circuit prevents the PLL from setting the SDA line to LOW, which would block the bus. The power-on reset flag POR is set at power-on and when V_{CC} falls below 3.2 V. It will be reset at the end of a READ operation.

5.1.2 Operating Range

Within the operational range the IC operates as described in the circuit description. The AC / DC characteristic limits are not guaranteed.

Table 5-2 Operating Range

Parameter	Symbol	Limit Values		Unit	Test Conditions	L	Item
		min	max				
Supply voltage	V_{CC}	+4.5	+5.5	V			
Programmable divider factor	N	256	32767				
LOW/MID Mixer input frequency range	f_i	30	500	MHz			
HIGH Mixer input frequency range	f_i	400	900	MHz			
LOW/MID Oscillator frequency range	f_O	65	560	MHz			
HIGH Oscillator frequency range	f_O	430	950	MHz			
Ambient temperature	T_{AMB}	-20	+85	°C			

5.1.3 AC/DC Characteristics

AC / DC characteristics involve the spread of values guaranteed in the specified supply voltage and ambient temperature range. Typical characteristics are the median of the production.

Output voltage causing 1 dB compression	V_o		121		dBµV	f_{RF} = 503.25 MHz		
	V_o		121		dBµV	f_{RF} = 799.25 MHz		
Mixer input impedance	R_i	14	20	26	Ω	serial equivalent circuit, f_{RF} = 600 MHz		
	L_i	6	10	14	nH	serial equivalent circuit, f_{RF} = 600 MHz		
Oscillator frequency shift, PLL unlocked	$\Delta f_{Osc(V)}$			400	kHz	V_S = 5 V±10%		

Table 5-3 AC/DC Characteristics with T_{AMB} = 25 °C, V_{CC} (continued)

	Symbol	Limit Values			Unit	Test Conditions	L	Item
		min	typ	max				
Oscillator frequency drift, PLL unlocked	$\Delta f_{Osc(T)}$			800	kHz	ΔT = 25 °C		
Oscillator frequency drift, PLL unlocked	$\Delta f_{Osc(t)}$			100	kHz	t = 5 s up to 15 min after switching on		
Oscillator pulling, PLL unlocked	V_i	100	108		dBµV	Δf = 10 kHz f_{RF} = 375.25 MHz		
	V_i	100	108		dBµV	Δf = 10 kHz f_{RF} = 847.25 MHz		
N + 5 pulling, PLL unlocked	V_i	-50			dBc	f_{RF} = 471.25 MHz, f_{RF1} = 511.25 MHz, P_{RF} =P_{RF1} = 80dBµV		
	V_i	-50			dBc	f_{RF} = 847.25 MHz, f_{RF1} = 887.25 MHz, P_{RF}=P_{RF1} = 80 dBµV		
Oscillator phase noise [1]	Φ_{OSC}	-58	-60		dBc/Hz	fm = 1kHz		
	Φ_{OSC}	-88	-90		dBc/Hz	fm = 10kHz		
IF suppression	a	15	20		dB	V_i = 80 dBµV		
SAW preamplifier								
IF output impedance, double ended	R_{IF}		125		Ω	serial equivalent circuit, f_{IF} = 38.9 MHz		
	L_{IF}		10		nH			
IF output impedance, single ended	R_{IF}		75		Ω	serial equivalent circuit, f_{IF} = 38.9 MHz		
	L_{IF}		5		nH			
Rejection at the IF outputs								
Divider interference level [2].	Vo			30	dBµV			
Channel S02 beat rejection [3].	INT_{S02}	66			dBc	f_{RF} = 76.25 MHz P_{RF} = 80 dBµV		

■ This value is only guaranteed in lab.

1). Measured in the evaluation board (see Chapter 4), worst case in band

2). This is the level of divider interferences close to the IF frequency. For example channel S3: fOSC = 158.15 MHz, 1/4 fOSC = 39.5375 MHz. Measured in the evaluation board (see Chapter 4).

3). Channel S02 beat is the interfering product of f_{RF}, f_{IF} and f_{OSC} of channel S02, f_{beat} = 37.35 MHz. The possible mechanisms are f_{OSC} - 2 x f_{IF} or 2 x f_{RFpix} - f_{OSC}. Measured in evaluation board (see Chapter 4).

5.2 Programming

Table 5-4 Bit Allocation Read / Write

Byte	MSB	bit6	bit5	bit4	bit3	bit2	bit1	LSB	Ack
Write Data									
Address Byte	1	1	0	0	0	MA1	MA0	0	A
Progr. Divider Byte 1	0	N14	N13	N12	N11	N10	N9	N8	A
Progr. Divider Byte 2	N7	N6	N5	N4	N3	N2	N1	N0	A
Control Byte	1	CP	T1	T0	FP	RSA	RSB	OS	A
Bandswitch Byte	x	x	x	x	x	PHIGH 1).	PLOW 1).2).	PMID 1). 2).	A
Read Data									
Address Byte	1	1	0	0	0	MA1	MA0	1	A
Status Byte	POR	FL	x	x	x	x	x	x	A

1). see Table 5-9 IC frequency range selection on page 11

2). In a tuner PLOW and PMID are interchangeable. Both bits switch the IC into LOW/MID (VHF) mode.

Table 5-5 Description of symbols

Symbol	Description
MA0, MA1	Address selection bits (see Table 5-6 Address selection on page 11)
N14 to N0	programmable divider bits: $N = 2^{14} \times N14 + 2^{13} \times N13 + ... + 2^3 \times N3 + 2^2 \times N2 + 2^1 \times N1 + N0$
CP	Charge pump current: bit = 0: charge pump current = 50 µA bit = 1: charge pump current = 220µA
T1, T0	test bits (see Table 5-7 Test modes on page 11)
FP	reserved for future purposes, actually ignored, default: 1
RSA, RSB	reference divider bits (see Table 5-8 Reference divider ratio on page 11)
OS	Tuning amplifier control bit: bit = 0: enable V_T bit = 1: disable V_T
PLOW, PMID, PHIGH	NPN ports control bits: bit = 0: NPN open-collector output is inactive bit = 1: NPN open-collector output is active (see Table 5-9 IC frequency range selection on page 11)
FL	PLL lock flag, bit = 1: loop is locked
POR	Power-on reset flag flag is set at power-on and reset at the end of READ operation
x	don't care

Table 5-6 Address selection

Voltage at AS	MA1	MA0
(0...0.1) * V_{CC}	0	0
open circuit	0	1
(0.4...0.6) * V_{CC}	1	0
(0.9...1) * V_{CC}	1	1

Table 5-7 Test modes

Test mode	T1	T0
Normal operation	0	0
Charge pump output, CP is in high-impedance state	0	1
PLOW = f_{div} output, PMID = f_{ref} output	1	0
not used	1	1

Table 5-8 Reference divider ratio

Reference divider ratio	f_{ref} 1).	RSA	RSB
80	50 kHz	0	0
128	31.25 kHz	0	1
24	166.7 kHz	1	0
64	62.5 kHz	1	1

1). With a 4 MHz quartz.

Table 5-9 IC frequency range selection

Frequency range	Bit 2 (PHIGH)	Bit 1 (PLOW) 1).	Bit 0 (PMID) 1.)
LOW/MID (VHF)	0	1	0
LOW/MID (VHF)	0	0	1
HIGH (UHF)	1	0	0

1). In a tuner PLOW and PMID are interchangeable. Both bits switch the IC into LOW/MID (VHF) mode.

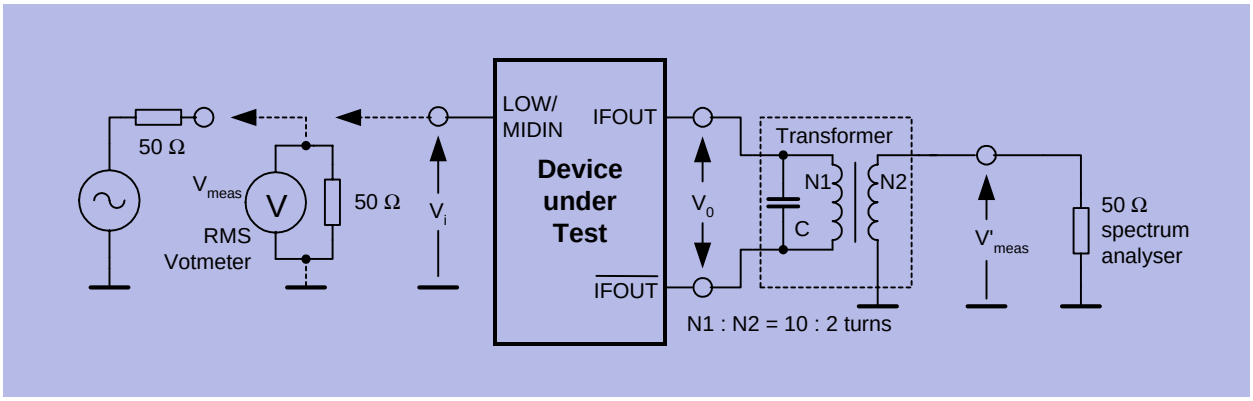
5.4 Test Circuits

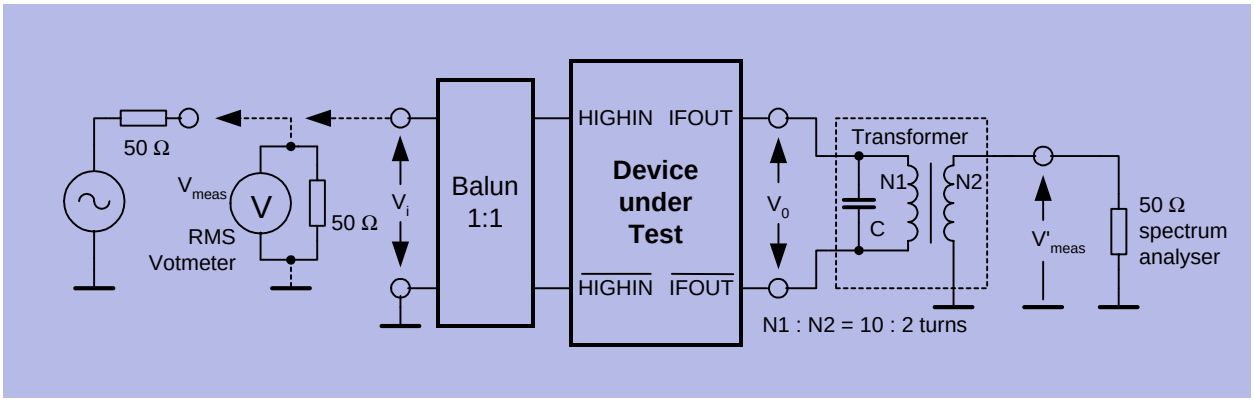
5.4.1 Gain (G_V) test Set-up in LOW/MID band



GVHF2

- Z_i >> 50 Ω => V_i = 2 x V_{meas} = 80 dBµV
- V_i = V_{meas} + 6dB = 80 dBµV
- V_0 = V'_{meas} + 16 dB (transformer ratio N1:N2 and transformer loss)
- G_v = 20 log(V_0 / V_i)

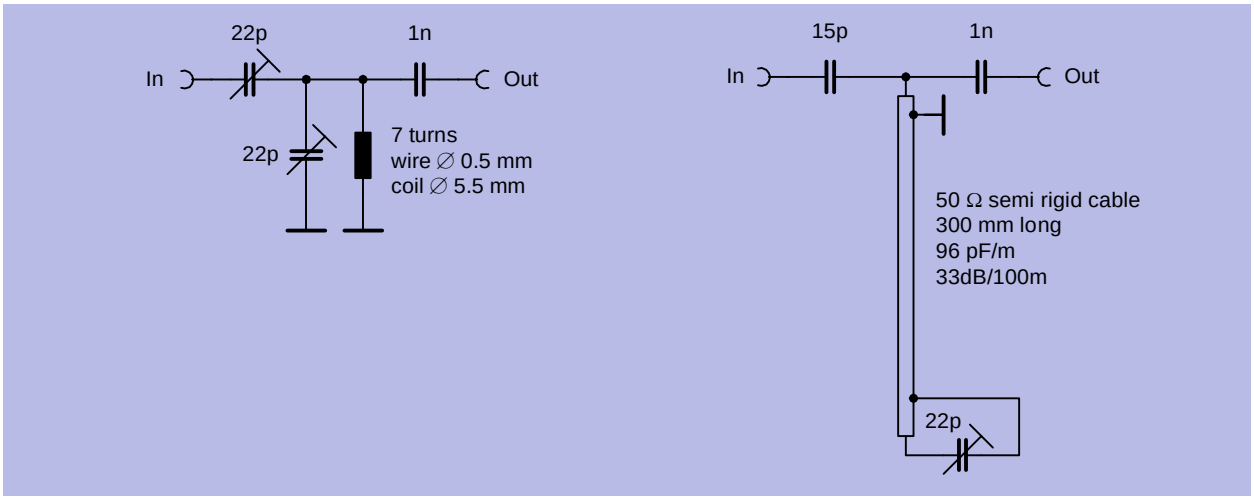
5.4.2 Gain (G_V) test Set-up in HIGH band



GUHF2

- V_i = V_{meas} = 70 dBµV
- V_0 = V'_{meas} + 16 dB (transformer ratio N1:N2 and transformer loss)
- G_v = 20 log(V_0 / V_i) + 1 dB (1 dB = insertion loss of balun)

5.4.3 Matching circuit for optimum noise figure in LOW/MID band



Nfm

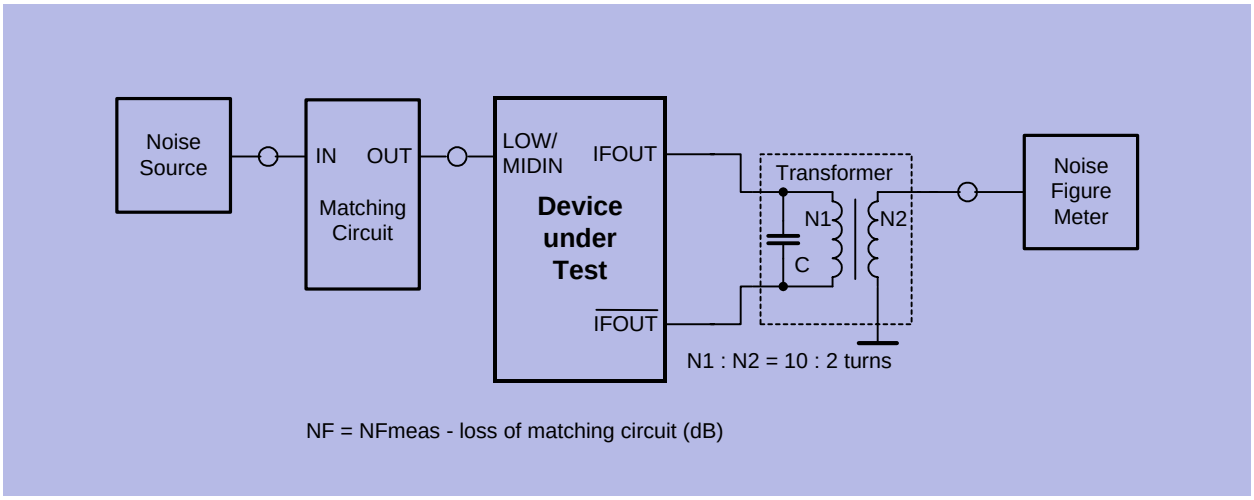
For f_{RF} = 50 MHz

- loss = 0 dB
- image suppression = 16 dB

For f_{RF} = 150 MHz

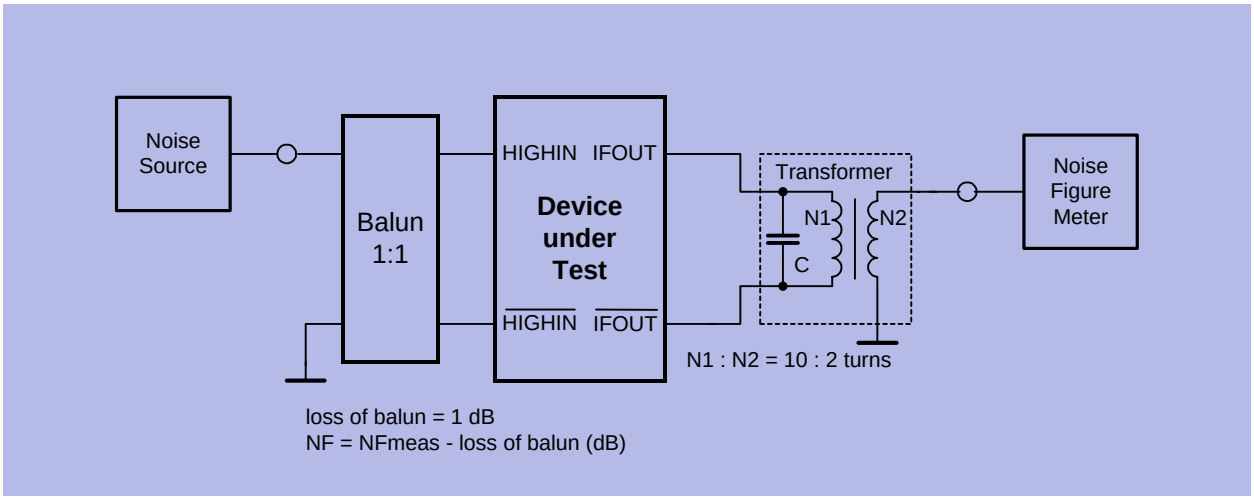
- loss = 1.3 dB
- image suppression = 13 dB

5.4.4 Noise Figure Test Set-up in LOW/MID band



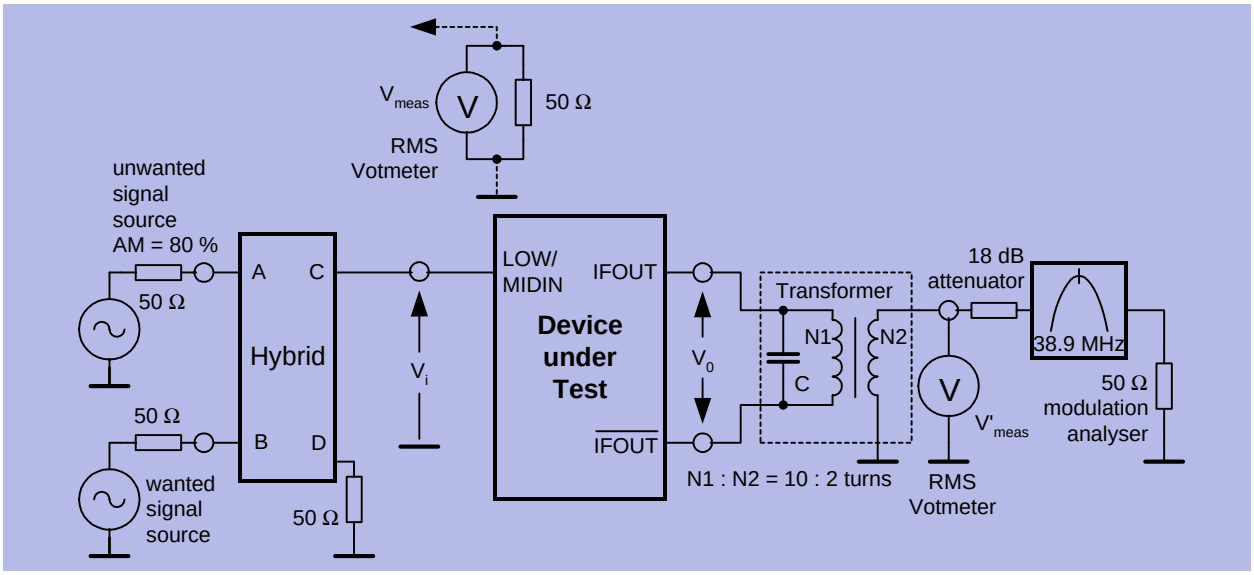
NFVHF2

5.4.5 Noise Figure Test Set-up in HIGH band



NFUHF2

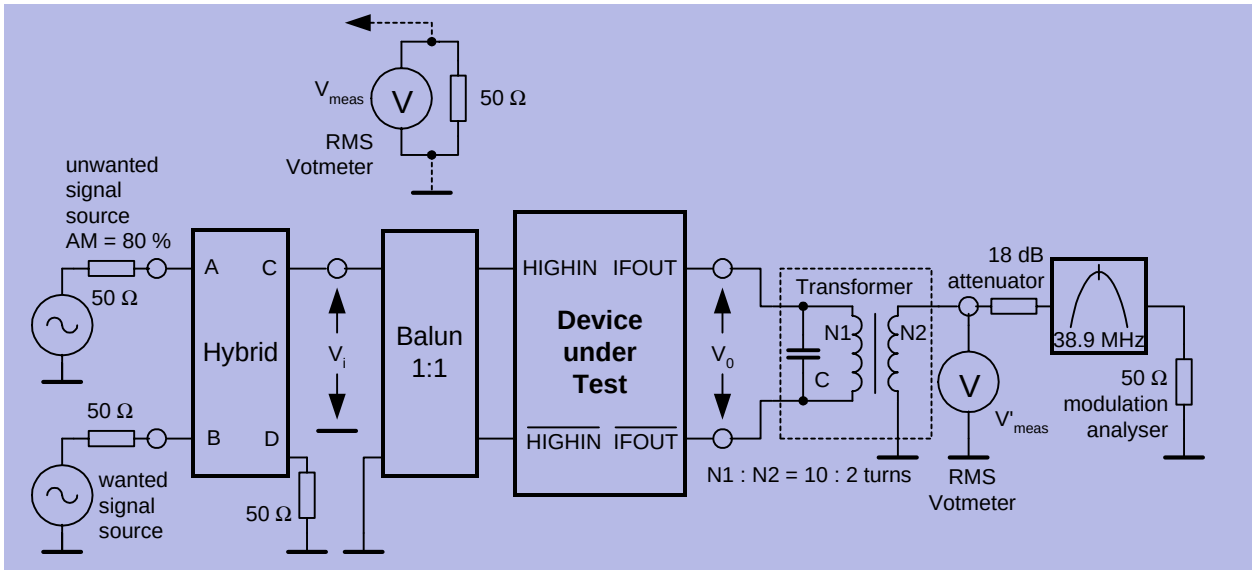
5.4.6 Cross modulation Test Set-up in LOW/MID band



XVHF2

- Z_i >> 50 Ω => V_i = 2 x V_{meas}
- V'_{meas} = V_0 - 16 dB (transformer ratio N1:N2 and transformer loss)
- wanted output signal at f_{pix}, V_o = 100 dBµV
- unwanted output signal at f_{snd}, 80 % AM modulated with 1 kHz

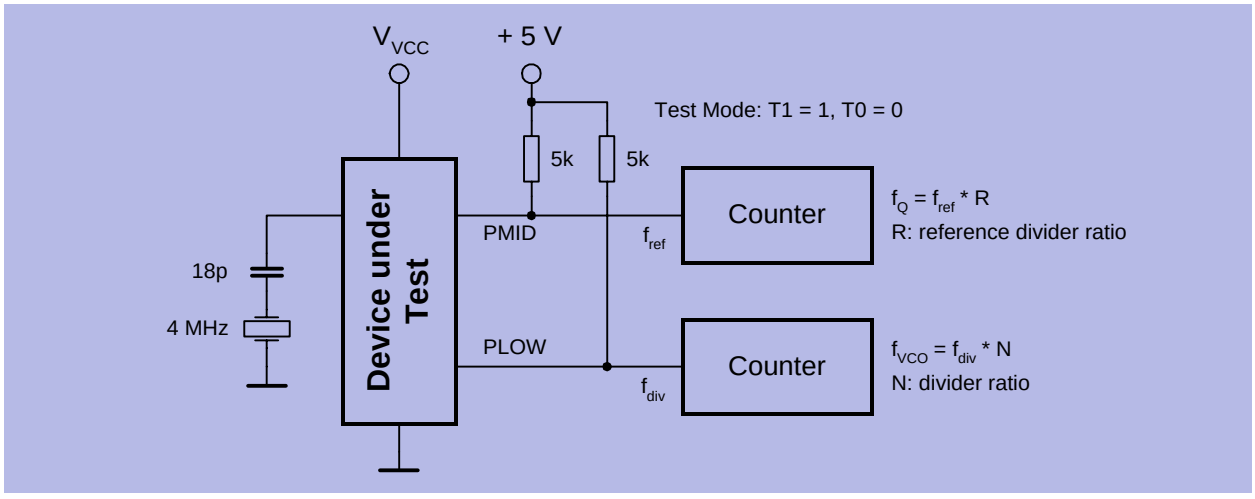
5.4.7 Cross modulation Test Set-up in HIGH band



XUHF2

- $V'_{meas} = V_0$ - 16 dB (transformer ratio N1:N2 and transformer loss)
- wanted output signal at f_{pix}, V_o = 100 dBµV
- unwanted output signal at f_{snd}, 80 % AM modulated with 1 kHz

5.4.8 Measurement of f_{ref} and f_{div}

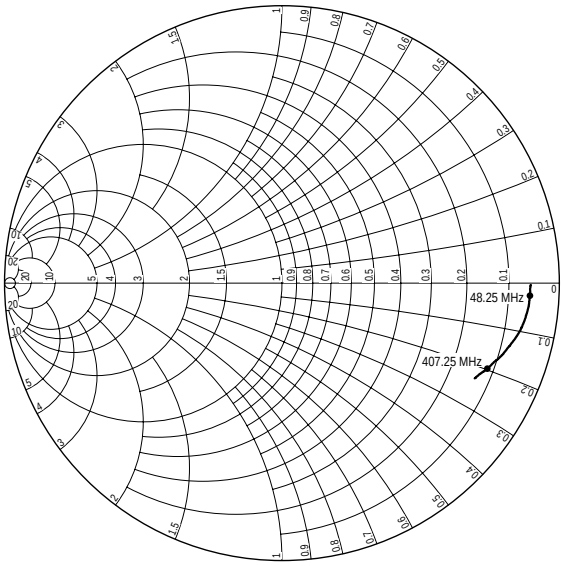


MEAS_COF

5.5 Electrical Diagrams

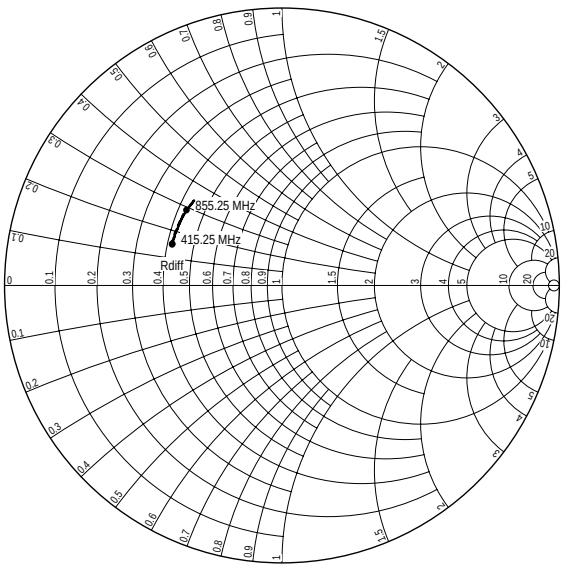
5.5.1 Input admittance (S11) of the LOW/MID band mixer input

Y_0 = 20mS (single ended)



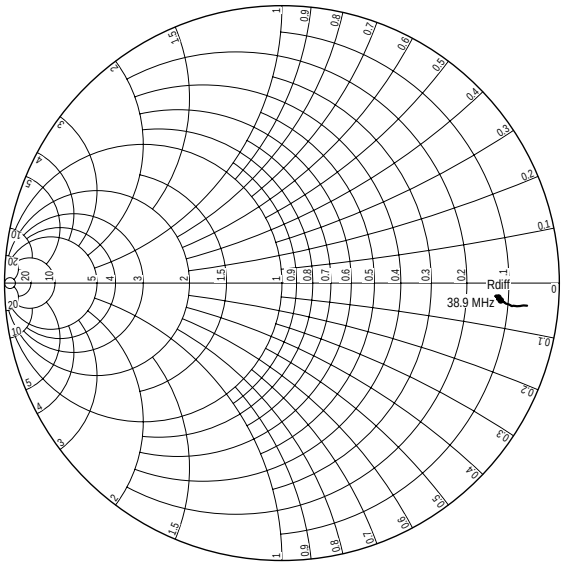
5.5.2 Input impedance (S11) of the HIGH band mixer input

Z_0 = 50 Ω (balanced)



5.5.3 Output admittance (S22) of the Mixer output

Y_0 = 20mS (balanced)



5.5.4 Output impedance (S22) of the IF output

Z_0 = 50 Ω (single/ double ended)
