Our commitment: quality and reliability

AEC-Q101

- ▶ We qualify our products according to the automotive AEC-Q101 standard and even exceed it's requirements, for instance when doing extended lifetime testing.

- ▶ All our processes and manufacturing plants are subject to regular international and internal audits, including the following:
 - ▶ ISO9001
 - ▶ ISO/TS 16949 for automotive sites
 - ▶ ISO14001
 - ▶ OHSAS18001

- ▶ NXP's Design for Excellence (DfX) program ensures that each new development builds on past learning and that best practices are always employed. The result is continual product improvement.

- ▶ Zero defect is our goal. To ensure continuous improvement failure analysis and the determination to find root causes is performed at all stages of development and production by adoption of quality-analysis tools and methods (e.g. Six-Sigma, Safe-Launch).

Rigorous attention to detail and commitment to quality have yielded a very low product failure rate of a single-digit part per billion (ppb).

Advantages of low V_{CEsat} (BISS) technology

Our BISS (Breakthrough In Small-Signal) transistors show lowest V_{CEsat} values due to an innovative mesh-emitter technology and further technology improvement. They also reduce board space due to improved collector-current capabilities as shown below.

Portfolio Overview Diodes

The best system-chip protection for high-speed data lines (USB 3.1, Type-C connector)

ESD protection characteristics that count

There are three key parameters for a perfect ESD protection device:

- ▶ High robustness against ESD pulses
- ▶ Low clamping / dynamic resistance – to protect the system chip
- ▶ Low capacitance – to maintain excellent signal integrity in high-speed interfaces

Some applications require good performance in only one or two of these areas. For the latest interfaces with the highest data rates, optimum performance in all three parameters is key. Until recently, improving one of these key parameters had a negative impact on the others. Addressing this challenge, NXP has developed a new ESD technology (TrEOS Protection) that delivers benchmark performance in all three key parameters.

Extremely low clamping voltage

Absorbing highest ESD pulses THE key for reliable system protection

- ▶ Low capacitance down to 0.1 pF
- ▶ High robustness up to 9A, 8/20 μs
- ▶ Packages optimized for communications interfaces

NFC antenna protection

DSN0603-2 (SOD962)
Single package
0.6 x 0.3 x 0.3 mm

Features

- ▶ Bidirectional configuration, allowing operating voltages up to 18 or 24 V
- ▶ Very low capacitance, enabling easy design of the antenna-matching circuit
- ▶ Very small voltage dependency of the diode capacitance, avoiding intermodulation distortion
- ▶ Small form-factor packages of 1006 (0402 inch) and 0603 (0201 inch) standard size

Benefits

The phone's NFC antenna is often integrated into the battery cover or the battery itself and is connected to the NFC tags via small contacts on the phone, creating an entry point for ESD strikes that are potentially hazardous to the NFC IC. These new NXP devices are optimized for the requirements of the NFC system and ensure the best-possible protection of the NFC IC.

Leadless DFN packages replace leaded packages

Leadless packages provide the same power capability compared to larger packages on a smaller size or provide a better thermal performance on the same footprint size. For that reason they replace established leaded packages in many applications.

NextPowerS3 – perfectly balanced for DC/DC switching applications

The challenge

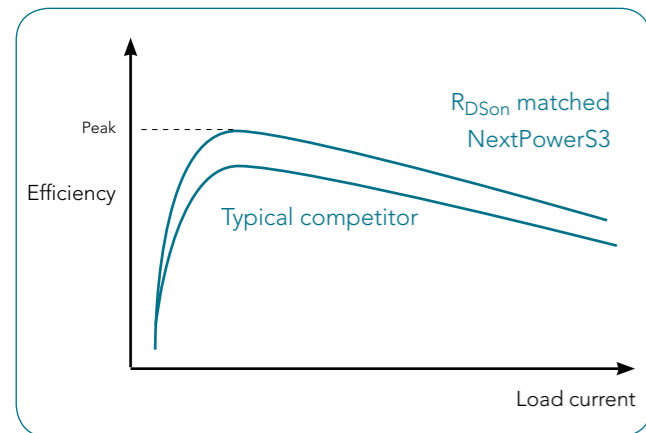

Low $R_{DS(on)}$ MOSFETs typically need a big die.

Low $Q_{g(tot)}$ MOSFETs typically need a small die.

The challenge for manufacturers is to create optimized power MOSFETs that have both low $R_{DS(on)}$ and low $Q_{g(tot)}$.

Welcome to NextPowerS3.

The Figure of Merit (FOM) of a MOSFET is calculated as the product of the $R_{DS(on)}$ and $Q_{g(tot)}$. A low FOM indicates good MOSFET performance in switching applications.

Comparing the performance of a NextPowerS3 MOSFET with a competitor of similar $R_{DS(on)}$ typically shows an efficiency performance advantage across the load range. Since conduction losses are the same for both devices, the advantage is more noticeable at lower loads where switching losses contribute proportionally more.

Using a NextPowerS3 MOSFET, with a higher $R_{DS(on)}$ than a competitor device, reduces the $Q_{g(tot)}$ still further, resulting in an improved peak efficiency. At higher loads, increased conduction losses cancel out the switching advantages and the two parts show similar performance.

Featured product: NextPowerS3

High switching frequencies

Increasing switching frequency from 300 KHz to 1 MHz allows a 70 - 80% reduction in inductor size. NextPowerS3's excellent switching performance enables such design choices with minimal loss of efficiency.

Low spiking

Typical competitor NextPowerS3

Thanks to optimised output capacitance, body diode and channel structure, NextPowerS3 MOSFETs exhibit "soft-recovery" switching behaviour, resulting in lower voltage spikes, faster decays and virtually no gate glitches.

Thermal efficiency

Packaged in the copper-clip based LFPACK package, NextPowerS3 features excellent thermal performance. As $R_{DS(on)}$ rises with temperature, keeping MOSFETs cool helps efficiency as well as reliability.

Low leakage

Unique SchottkyPlus technology offers the benefits of an integrated Schottky diode without the problems associated with leakage current.

Specialist high sides

The NextPowerS3 portfolio contains devices with multiple busbars and low R_g optimized for use as control FETs, further improving system efficiencies.

Improved SOA

A wide cell pitch makes NextPowerS3 an excellent choice for hot-swap, e-Fuse, and power OR-ing applications.

NextPower Live! MOSFETs
for a non-stop world
 Reliable linear-mode performance
AND low R_{DSon} efficiency
 in *hot-swap* and *soft-start* applications

The importance of cell design

The outstanding performance of NextPowerS3 is largely attributable to NXP's unique "Super-junction" technology and optimization of cell structures.

Most manufacturers of low-voltage MOSFETs use "Split Gate" technology to achieve low R_{DSon} .

NextPowerS3 uses a different approach to its cell design.

The drive for R_{DSon}

A MOSFET's R_{DSon} is given by the formula:

$$R_{DSon} = R_{channel} + R_{drift} + R_{substrate} + (R_{package})$$

Many manufacturers focus on reducing $R_{channel}$ to drive R_{DSon} down.

NXP's Super-junction allows for an optimization of all three components for reduction in R_{DSon} , while also enhancing switching performance and Safe Operating Area (SOA).

Maximizing switching performance

Switching losses result from the energy required to charge / discharge all the cell capacitances across the device. The total charge required is referred to as $Q_{g(tot)}$.

With NextPower S3, $Q_{g(tot)}$ is lower and switching losses are kept to a minimum. This is especially beneficial at peak efficiency and in higher-frequency designs, which have a higher number of switching events.

SOA and other benefits

When a device is operating in its linear mode, the channel current generates localized heating effects, which can cause failure.

NXP has optimized the cell structure to keep this heating effect under control. As a result, NextPowerS3 enjoys a particularly strong SOA, which is important in hot-swap, e-Fuse, and power OR-ing designs.

Mobile phones, ATMs, the internet, traffic signals – so much of our daily life depends on 24/7/365 computers, communications, and storage, made possible by rack-based systems that can be maintained with the power on. NextPower Live MOSFETs are designed specifically for such applications:

- ▶ When a replacement board is plugged into a live system, it is important that the in-rush current is carefully controlled, so as to protect the components on the board and ensure that other parts of the system experience no power disruption. This application requires MOSFETs with strong linear mode performance and a wide safe operating area (SOA) to manage current effectively and reliably.
- ▶ Once the replacement board is safely installed, the MOSFET is turned fully ON. In this mode of operation, a low R_{DSon} is of primary importance, helping to keep temperatures low while maximizing system efficiency.
- ▶ Only NextPower Live MOSFETs offer reliable linear mode performance **AND** low R_{DSon} efficiency.

- ▶ Battery-powered tools, including everything from small engraving devices and screwdrivers to heavy-duty saws and agricultural tools, present a wide variety of requirements for driving the motor. The MOSFETs used in these systems have to perform at demanding levels and must have:
 - ▶ Low on-resistance for optimum battery life
 - ▶ Low thermal resistance for reduced junction temperature (for greater reliability)
 - ▶ High current capability (when the motor stalls, for example)
 - ▶ Choice of logic- and standard-level gate drives, depending on battery voltage
 - ▶ Excellent avalanche ruggedness to withstand high-load conditions
 - ▶ Environmental robustness (wide operating/storage temperatures, harsh vibrations)
 - ▶ Competitive cost
- Overall, the motor-control MOSFET needs to deliver automotive-grade performance at a commercially competitive price

Typical Power Tools MOSFET internal construction

NXP has developed a range of MOSFETs specifically aimed at motor-control applications. These are based on our highly reliable, automotive-qualified silicon, with specific package enhancements such as thicker wires and multiple bond points (“stitch bonding”) to spread the current evenly over the die surface.

NXP’s long history in automotive MOSFETs means we have the know-how to produce devices with excellent avalanche ruggedness. The same expertise deployed in power steering and ABS systems worldwide is put to use in our devices for motor control and that means performance you can count on.

Max current ($I_D[max]$) depends largely on the number and diameter of the aluminium bond wires. The NXP Power Tools portfolio is typically based on a standard of three 500 μm wires, allowing for an $I_D[max]$ rating of up to 150 A in a TO220 package.

Some low R_{DSon} devices, based on NXP’s LFPAK56 (Power-SO8 compatible) package, can support an $I_D[max]$ of 300A, perfect for power tool applications where the motor control MOSFETs must be able to support high torque levels, even during “locked-rotor” events.

Heavy-duty tools with large batteries require MOSFETs that withstand higher currents. NXP's TO-220 NextPower Cordless devices handle up to 150A. The high-reliability LFPAK56 is ideal for smaller tools and space-constrained applications.

D²PAK Family

D²PAK Family - Premium performance SMD products

The NXP D²PAK portfolio is ideally suited for high power automotive application areas such as powertrain and chassis & safety. Combining advanced TrenchMOS technology with high current packaging enables a product that delivers ultra low on-state resistance and thermal performance within an industry standard footprint. NXP offers the broadest range of automotive grade D²PAK across V_{DS} 30V-100V.

Fully AEC-Q101 qualified to 175 °C

Fully AEC-Q101 qualified to 175 °C

I²PAK/TO-220

I²PAK/TO-220 - High performance through-hole products

Providing industry leading performance for through hole products NXP's I²PAK/TO-220 portfolio enables the separation of the electrical and thermal pathways to optimise module performance. The convenience of the tab for screw mounting on the TO-220 is complemented by industry standard footprint and excellent current handling performance. Similarly the I²PAK can be readily soldered down to form a low resistance path.

TrenchPLUS MOSFETs

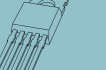

TrenchPLUS is a range of standard MOSFETs with additional protection features, such as current and temperature sensing components, overvoltage clamps, and gate-protection (ESD) diodes. The system microcontroller can use data gathered from these

sensors to implement cost-effective protection features, thus eliminating the need to design with protected power devices. All the standard products listed below offer one or more "PLUS" features. Custom versions can be developed for high-volume applications.
