

- Low Offset Characteristics
- High Differential Voltage Amplification
- Fast Response Times
- Output Compatible with Most TTL Circuits

description

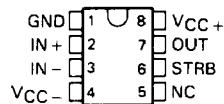

The TL510 monolithic high-speed voltage comparator is an improved version of the TL710 with an extra stage added to increase voltage amplification and accuracy, and a strobe input for greater flexibility. Typical voltage amplification is 33,000. Since the output cannot be more positive than the strobe, a low-level input at the strobe will cause the output to go low regardless of the differential input. Component matching, inherent in integrated circuit fabrication techniques, produces a comparator with low-drift and low-offset characteristics. These circuits are particularly useful for applications requiring an amplitude discriminator, memory sense amplifier, or a high-speed limit detector.

The TL510M is characterized for operation over the full military temperature range of -55°C to 125°C ; the TL510C is characterized for operation from 0°C to 70°C .

Continuous total power dissipation at (or below) 70°C free-air temperature (see Note 3)	300 mW
Operating free-air temperature range: TL510M Circuits	-55°C to 125°C
TL510C Circuits	0°C to 70°C
Storage temperature range	-65°C to 150°C
Lead temperature 1.6 mm (1/16 inch) from case for 60 seconds: FH, FK, JG, or U package	300°C
Lead temperature 1.6 mm (1/16 inch) from case for 10 seconds: P package	260°C

NOTES: 1. All voltage values, except differential voltages, are with respect to the network ground terminal.

2. Differential voltages are at the noninverting input terminal with respect to the inverting input terminal.

3. For operation of the TL510M above 70°C free-air temperature, refer to Dissipation Derating Curves, Section 2. In the JG package, TL510M chips are alloy mounted and TL510C chips are glass mounted.

[†]Unless otherwise noted, all characteristics are measured with the strobe open. Full range (MIN to MAX) for TL510M is -55°C to 125°C and for the TL510C is 0°C to 70°C.

[‡]These typical values are at $T_A = 25^\circ\text{C}$.

[§]The algebraic convention, where the most-positive (least negative) limit is designated as maximum, is used in this data sheet for logic levels only, e.g., when 0 V is the maximum, the minimum limit is a more-negative voltage.

NOTE 4: These characteristics are verified by measurements at the following temperatures and output voltage levels: for TL510M, $V_O = 1.8 \text{ V}$ at $T_A = -55^\circ\text{C}$, $V_O = 1.4 \text{ V}$ at $T_A = 25^\circ\text{C}$, and $V_O = 1 \text{ V}$ at $T_A = 125^\circ\text{C}$; for TL510C, $V_O = 1.5 \text{ V}$ at $T_A = 0^\circ\text{C}$, $V_O = 1.4 \text{ V}$ at 25°C , and $V_O = 1.2 \text{ V}$ at $T_A = 70^\circ\text{C}$. These output voltage levels were selected to approximate the logic threshold voltages of the types of digital logic circuits these comparators are intended to drive.

PARAMETER	TEST CONDITIONS			MIN	TYP	MAX	UNIT
Response time	$R_L = \infty$	$C_L = 5\text{ pF}$	See Note 5		30	80	ns
Strobe release time	$R_L = \infty$	$C_L = 5\text{ pF}$	See Note 6		5	25	ns

NOTES: 5. The response time specified is for a 100-mV input step with 5-mV overdrive.

6. For testing purposes, the input bias conditions are selected to produce an output voltage of 1.4 V. A 5-mV overdrive is then added to the input bias voltage to produce an output voltage that rises above 1.4 V. The time interval is measured from the 50% point of the strobe voltage curve to the point where the overdriven output voltage crosses the 1.4 V level.
