

Single/Dual/Triple/Quad Operational Amplifiers

ICL761X-ICL764X

General Description

The ICL761X-ICL764X family of monolithic CMOS op amps combine ultra-low input current with low-power operation over a wide supply voltage range. With pin-selectable quiescent currents of 10 μ A, 100 μ A, or 1000 μ A per amplifier, these op amps will operate from \pm 1V to \pm 8V power supplies, or from single supplies from 2V to 16V. The CMOS outputs swing to within millivolts of the supply voltages.

The ultra-low bias current of 1pA makes this family of op amps ideal for long time constant integrators, picoammeters, low droop rate sample/hold amplifiers and other applications where input bias and offset currents are critical. A low noise current of 0.01pA \sqrt Hz and an input impedance of 10¹² Ω ensure optimum performance with very high source impedances in such applications as pH meters and photodiode amplifiers.

Applications

- Battery-Powered Instruments
- Low-Leakage Amplifiers
- Long-Time Constant Integrators
- Low-Frequency Active Filters
- Hearing Aids and Microphone Amplifiers
- Low Droop Rate Sample/Hold Amplifiers
- Picoammeters

Pin Configuration

Features

- ◆ Pin-for-Pin Second Source
- ◆ 1pA Typical Bias Current—4nA (max) at +125°C
- ◆ \pm 1V to \pm 8V Wide Supply Voltage Range
- ◆ Industry-Standard Pinouts
- ◆ Programmable Quiescent Currents of 10 μ A, 100 μ A, and 1000 μ A
- ◆ Monolithic, Low-Power CMOS Design

Ordering Information

| ICL76XX | M | N | OP |
|---------|---------------------------|---------------------|-------------------------|
| | V _{OS} SELECTION | TEMP RANGE | PKG CODE |
| | A = 2mV | C = 0°C to 70°C | TV= 8-Pin TO-99 |
| | B = 5mV | E = -40°C to +85°C | PA = 8-Pin Plastic Dip |
| | C = 10mV | M = -55°C to +125°C | SA = 8-Pin Small SO |
| | D = 15mV | | JD = 14-Pin Cerdip |
| | E = 20mV | | PD = 14-Pin Plastic Dip |
| | | | SD = 14-Pin Small SO |
| | | | JE = 16-Pin Cerdip |
| | | | PE = 16-Pin Plastic Dip |
| | | | SE = 16-Pin Small SO |
| | | | WE = 16-Pin Wide SO |

Typical Operating Circuit appears at end of data sheet.

Single/Dual/Triple/Quad Operational Amplifiers

ABSOLUTE MAXIMUM RATINGS (Single/Dual)

| | |
|---|-----------------------------|
| Total Supply Voltage (V+ to V-) | +18V |
| Input Voltage | (V+ + 0.3V) to (V- - 0.3V) |
| Differential Input Voltage (Note 1) | ±(V+ + 0.3V) to (V- - 0.3V) |
| Duration of Output Short Circuit (Note 2) | Unlimited |
| Continuous Power Dissipation (T _A = +25°C) | |
| TO-99 Metal Can (derate 2mW/°C above +25°C) | 250mW |
| 8-Pin Minidip (derate 2mW/°C above +25°C) | 250mW |
| 14-Pin Plastic (derate 3mW/°C above +25°C) | 375mW |
| 14-Pin CERDIP (derate 4mW/°C above +25°C) | 500mW |
| 16-Pin Plastic (derate 3mW/°C above +25°C) | 375mW |
| 16-Pin CERDIP (derate 4mW/°C above +25°C) | 500mW |

Operating Temperature Ranges:

| | |
|-----------------------------------|-----------------|
| M Series | -55°C to +125°C |
| E Series | -40°C to +85°C |
| C Series | -0°C to +70°C |
| Storage Temperature Range | -55°C to +150°C |
| Lead Temperature (soldering, 10s) | +300°C |
| Soldering Temperature (reflow) | |
| Lead(Pb)-Free Packages | +260°C |
| Packages Containing Lead | +240°C |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 1: Long-term offset voltage stability will be degraded if large input differential voltages are applied for long periods of time.

Note 2: The outputs may be shorted to ground or to either supply for V_{SUPP} ≤ 10V. Care must be taken to insure that the dissipation rating is not exceeded.

ELECTRICAL CHARACTERISTICS (Single/Dual)

Pin Configurations

Single/Dual/Triple/Quad Operational Amplifiers

ABSOLUTE MAXIMUM RATINGS (Triple/Quad)

| | | | |
|---|----------------------------------|--|----------------------|
| Total Supply Voltage (V+ to V-) |+18V | 16-Pin Plastic (derate 3mW/°C above +25°C) |375mW |
| Input Voltage |(V+ + 0.3V) to (V- - 0.3V) | 16-Pin CERDIP (derate 4mW/°C above +25°C) |500mW |
| Differential Input Voltage (Note 5) |±1(V+ + 0.3V) - (V- - 0.3V) | Operating Temperature Ranges: | |
| Duration of Output Short Circuit (Note 6) |Unlimited | M Series |-55°C to +125°C |
| Continuous Power Dissipation (TA = +25°C) | | E Series |-40°C to +85°C |
| TO-99 Metal Can (derate 2mW/°C above +25°C) |250mW | C Series |-0°C to +70°C |
| 8-Pin Minidip (derate 2mW/°C above +25°C) |250mW | Storage Temperature Range |-55°C to +150°C |
| 14-Pin Plastic (derate 3mW/°C above +25°C) |375mW | Lead Temperature (soldering, 10s) |+300°C |
| 14-Pin CERDIP (derate 4mW/°C above +25°C) |500mW | | |

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 5: Long-term offset voltage stability will be degraded if large input differential voltages are applied for long periods of time.

Note 6: The outputs may be shorted to ground or to either supply for VSUPP ≤ 10V. Care must be taken to insure that the dissipation rating is not exceeded.

ELECTRICAL CHARACTERISTICS (Triple/Quad)

(VSUPP = ±1.0V, IQ = 10µA, TA = +25°C, unless otherwise noted.) (Specifications apply to ICL7631/7632/7642 only.)

Detailed Description

Quiescent Current Selection

The voltage input to the I_Q pin of the single and triple amplifiers selects a quiescent current (I_Q) of 10μA, 100μA, or 1000μA. The dual and quad amplifiers have fixed quiescent current (I_Q) settings. Unity-gain bandwidth and slew-rate increase with increasing quiescent current, as does output sink current capability. The output source current capability is independent of quiescent current.

The lowest I_Q setting that results in sufficient bandwidth and slew rate should be selected for each specific application.

The I_Q pin of the single and triple amplifiers controls the quiescent current as follows:

| | |
|------------------------|--|
| I _Q = 10μA | I _Q pin to V ₊ |
| I _Q = 100μA | I _Q pin between V ₋ + 0.8V and V ₊ - 0.8V |
| I _Q = 1mA | I _Q pin to V ₋ |

Input Offset Nulling

The input offset can be nulled by connecting a 25kΩ pot between the OFFSET terminals with the wiper connected to V₊. At quiescent currents of 1mA and 100μA, the nulling range provided is adequate for all V_{OS} selections. However, with higher values of V_{OS}, and an I_Q of 10μA, nulling may not be possible.

Frequency Compensation

All of the ICL7611 and ICL7621 series except the ICL7614 are internally compensated for unity-gain operation. The ICL7614 is externally compensated by a capacitor connected between COMP and OUT pins, with 39pF being greater than unity. The compensation capacitor value may be reduced to increase the bandwidth and slew rate. The ICL7132 is not compensated and does not have frequency compensation pins. Use only at gains 20 at I_Q of 1mA; at gains > 10 at I_Q of 100μA; at gain > 5 at I_Q of 10μA.

Output Loading Considerations

Approximately 70% of the amplifier's quiescent current flows in the output stage. The output swing can approach the supply rails for output loads of 1MΩ, 100kΩ, and 10kΩ, using the output stage in a highly linear Class A mode. Crossover distortion is avoided

and the voltage gain is maximized in this mode. The output stage, however, can also be operated in Class AB, which supplies higher output currents (see the *Typical Operating Characteristics*). The voltage gain decreases and the output transfer characteristic is non-linear during the transition from Class A to Class B operation.

The output stage, with a gain that is directly proportional to load impedance, approximates a transconductance amplifier. Approximately the same open-loop gains are obtained at each of the I_Q settings if corresponding loads of 10kΩ, 100kΩ, and 1MΩ are used.

The maximum output source current is higher than the maximum sink current, and is independent of I_Q.

Like most amplifiers, there are output loads for which the amplifier stability is not guaranteed. In particular, avoid capacitive loads greater than 100pF; and while on the 1mA I_Q setting, avoid loads less than 5kΩ. Since the output stage is a transconductance output, very large (>10μF) capacitive loads will create a dominant pole and the output will be stable, even with loads that are less than 5kΩ.

Extended Common-Mode Voltage Range (ICL7612/ICL7616)

A common-mode voltage range that includes both V₊ and V₋ is often desirable, especially in single-supply operation. The ICL7612/ICL7616 extended common-mode range op amps are designed specifically to meet this need. The ICL7612 input common-mode voltage range (CMVR) extends beyond both power-supply rails when operated with at least 3V total supply and an I_Q of 10μA or 100μA. The ICL7616 CMVR includes the negative supply voltage (or ground when operated with a single supply) at an I_Q of 10μA or 100μA.

PC Board Layout

Careful PC board layout techniques must be used to take full advantage of the very low bias current of the ICL7611 family. The inputs should be encircled with a low-impedance trace, or guard, that is at the same potential as the inputs. In an inverting amplifier, this is normally ground; in a unity-gain buffer connect the guard to the output. A convenient way of guarding the 8-pin TO-99 version of the ICL7611 is to use a 10-pin circle, with the two extra pads on either side of the input pins to provide space for a guard ring (see Figure 8). Assembled boards should be carefully cleaned, and if a high humidity environment is expected, conformally coated.

Single/Dual/Triple/Quad Operational Amplifiers

Single-Supply Operation

The ICL7611 family will operate from a single 2V to 16V power supply. The common-mode voltage range of the standard amplifier types when operated from a single supply is 1.0V to (V+ - 0.6V) at 10µA I_Q. At 100µA I_Q, the CMVR is 1.0V to (V+ - 0.8V), and at 1mA I_Q, the CMVR is 1.3V to (V+ - 1.3V). If this CMVR range is insufficient, use the ICL7612, whose CMVR includes both ground and V+, or the ICL7616, whose CMVR includes ground.

A convenient way to generate a psuedo-ground at V+/2 is to use one op amp of a quad to buffer a V+/2 voltage from a high-impedance resistive divider.

Figure 1. Instrumentation Amplifier—Adjust R3 to improve CMRR. The offset of all three amplifiers is nulled by the offset adjustment of A2.

Low-Voltage Operation

Operation at V_{SUPP} = ±1.0V is only guaranteed at I_Q = 10µA. Output swings to within a few millivolts of the supply rails are achievable for R_L (> or =) 1MΩ. Guaranteed input CMVR is ±0.6V minimum and typically +0.9V to -0.7V at V_{SUPP} = ±1.0V. For applications where greater common-mode range is desirable, see the description of ICL7612 and ICL7616 above.

Applications Information

Note that in no case is I_Q shown. The value of I_Q must be chosen by the designer with regard to frequency response and power dissipation.
