

10-Bit, Low-Power, Quad, Voltage-Output DAC with Serial Interface

MAX5741

General Description

The MAX5741 quad, 10-bit, low-power, buffered voltage-output, digital-to-analog converter (DAC) is packaged in a space-saving 10-pin μ MAX[®] package (5mm \times 3mm). The wide supply voltage range of +2.7V to +5.5V and 229 μ A supply current accommodates low-power and low-voltage applications. DAC outputs employ on-chip precision output amplifiers that swing rail-to-rail. The MAX5741's reference input accepts a voltage range from 0 to V_{DD} . In power-down the reference input is high impedance, further reducing the system's total power consumption.

The 20MHz, 3-wire SPI[™], QSPI[™], MICROWIRE[™] and DSP-compatible serial interface saves board space and reduces the complexity of opto- and transformer-isolated applications. The MAX5741 on-chip power-on reset (POR) circuit resets the DAC outputs to zero and loads the output with a 100k Ω resistor to ground. This provides additional safety for applications that drive valves or other transducers that need to be off on power-up. The MAX5741's software controlled power-down reduces supply current to less than 1 μ A and provides software-selectable output loads (1k Ω , 100k Ω , or high impedance) while in power-down. The MAX5741 is specified over the -40 $^{\circ}$ C to +125 $^{\circ}$ C extended temperature range and available in a 10-pin μ MAX package

Applications

Automatic Tuning
Gain and Offset Adjustment
Power Amplifier Control
Process Control I/O Boards
Battery-Powered Instruments
VCO Control

Functional Diagram appears at end of data sheet.

SPI and QSPI are trademarks of Motorola, Inc.

MICROWIRE is a trademark of National Semiconductor, Corp.

Features

- ◆ Ultra-Low Power Consumption
 - 229 μ A at $V_{DD} = +3.6V$
 - 271 μ A at $V_{DD} = +5.5V$
- ◆ Wide +2.7V to +5.5V Single-Supply Range
- ◆ 10-Pin μ MAX Package
- ◆ 0.3 μ A Power-Down Current
- ◆ Guaranteed 10-Bit Monotonicity (± 1 LSB DNL)
- ◆ Safe Power-Up Reset to Zero Volts at DAC Output
- ◆ Three Software-Selectable Power-Down Impedances (100k Ω , 1k Ω , Hi-Z)
- ◆ Fast 20MHz, 3-Wire SPI, QSPI, and MICROWIRE-Compatible Serial Interface
- ◆ Rail-to-Rail Output Buffer Amplifiers
- ◆ Schmitt-Triggered Logic Inputs for Direct Interfacing to Optocouplers
- ◆ Wide -40 $^{\circ}$ C to +125 $^{\circ}$ C Operating Temperature Range

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX5741EUB	-40 $^{\circ}$ C to +85 $^{\circ}$ C	10 μ MAX
MAX5741AUB	-40 $^{\circ}$ C to +125 $^{\circ}$ C	10 μ MAX

Pin Configuration

10-Bit, Low-Power, Quad, Voltage-Output DAC with Serial Interface

ABSOLUTE MAXIMUM RATINGS

V_{DD} to GND-0.3V to +6V
 OUT₋, SCLK, DIN, \overline{CS} , REF to GND-0.3 to (V_{DD}+0.3V)
 Maximum Continuous Current Into Any Pin±50mA
 Continuous Power Dissipation (T_A = +70°C)
 10-Pin μ MAX (derate 6.9 mW/°C above +70°C)555mW

Operating Temperature Range-40°C to +125°C
 Junction Temperature-65°C to +150°C
 Storage Temperature Range-65°C to +150°C
 Lead Temperature (soldering, 10s)+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{DD} = +2.7V to +5.5V, GND = 0, V_{REF} = V_{DD}, R_L = 5k Ω , C_L = 200pF, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are V_{DD} = +5V, T_A = +25°C.)

MAX5741

Pin Description

PIN	NAME	FUNCTION
1	$\overline{\text{CS}}$	Chip-Select Input
2	SCLK	Serial Clock Input
3	V _{DD}	Power-Supply Input
4	GND	Ground
5	DIN	Serial Data Input
6	REF	External Reference Voltage Input
7, 8, 9, 10	OUTA–OUTD	DAC Voltage Outputs. Power-on reset sets DAC registers to zero, and internally connects OUT to GND with 100k Ω resistor.

Detailed Description

The MAX5741 contains four 10-bit, voltage-output, low-power digital-to-analog converters (DACs). Each DAC employs a resistor word string architecture that converts a 10-bit digital input word to an equivalent analog output voltage proportional to the applied reference voltage. The MAX5741 shares one reference input (REF) between all four DACs. The MAX5741 includes rail-to-rail output buffer amplifiers for each DAC, and input logic for simple microprocessor (μP), and CMOS interfaces. The power-supply range is from +2.7V to +5.5V (*Functional Diagram*). The MAX5741's reference input accepts a voltage range from 0 to V_{DD}. In power-down mode the reference input is high impedance. The MAX5741 is compatible with the 3-wire SPI, QSPI, MICROWIRE, and DSP serial interface with Schmitt-triggered logic inputs.

Reference Input and DAC Output Range

The reference input accepts positive DC and AC signals. The voltage at REF sets the full-scale output voltage of the four DACs. The reference input voltage range is 0 to V_{DD}. The impedance at REF is 45k Ω . The voltage at REF can vary from GND to V_{DD}. The output voltages (V_{OUT_}) are represented by a digitally programmable voltage source as:

$$V_{\text{OUT}_} = (V_{\text{REF}} \times D) / 2^{10}$$

where D is the decimal equivalent of binary DAC input code ranging from 0 to 1023. V_{REF} is the voltage at REF.

Output Buffer Amplifiers

All DACs are internally buffered at the output. The buffer amplifiers have both rail-to-rail common mode and (GND to V_{REF}) output voltage range. The buffers are unity-gain stable with C_L = 200pF and R_L = 5k Ω . Buffer amplifiers are disabled during power-up and individual DAC outputs are shorted to GND through a 100k Ω resistor. Buffer amplifiers can individually or altogether be powered-down by programming the input register control bits. During power down, contents of the input and DAC registers remain the same. On wake-up all DAC outputs are restored to their pre-power down voltage values.

Power-Down Mode

In power-down mode, the DAC outputs are programmed to one of three output states, 1k Ω , 100k Ω , or floating (Table 1). The REF input is high impedance (2M Ω typ) to conserve current drain from the system reference; therefore, the system reference does not have to be powered-down. The DAC outputs return to the values contained in the registers when brought out of power-down. The recovery time, from total power-down to power-up, is 8 μs . This extra time is needed to allow the internal bias to wake-up. Power-down mode reduces current consumption to 0.3 μA .

3-Wire Serial Interface

The MAX5741 digital interface is a standard 3-wire connection compatible with SPI/QSPI/MICROWIRE/DSP interfaces. The chip-select input ($\overline{\text{CS}}$) frames the serial data loading at DIN. Immediately following $\overline{\text{CS}}$ high-to-low transition, the data is shifted synchronously and latched into the input register on the falling edge of the serial clock input (SCLK). After 16 bits have been loaded into the serial input register, it transfers its con-

1	1	1	1	X	1	0	0	1	1	DAC A-D	Output is terminated with 100kΩ

X = Don't Care

tents to the DAC latch. \overline{CS} may then either be held low or brought high. \overline{CS} must be brought high for a minimum of 80ns before the next write sequence, since a write sequence is initiated on a falling edge of \overline{CS} . Not keeping \overline{CS} low during the first 15 SCLK cycles discards input data. The serial clock (SCLK) can idle either high or low between transitions.

The MAX5741 has two internal registers per DAC, the input register and the DAC register. The input register holds the data that is waiting to be shifted to the DAC register. All four input registers can be loaded without updating the output. This function is useful when all outputs need to be updated at the same time. The input register can be made transparent. When the input register is transparent, the data written into DIN loads directly to the DAC register and the output is updated.

The DAC output is not updated until data is written to the DAC register. See Table 2 for a list of serial-interface programming commands.

Power-On Reset (POR)

The MAX5741 has an internal POR circuit. At power-up all DACs are powered-down and $OUT_{_}$ is terminated to GND through 100kΩ resistors. Contents of input and DAC registers are cleared to all zero. 8μs recovery time after issuing a wake-up command is needed before writing to the DAC registers. Power-down mode control commands can be applied immediately with no recovery time.

C3–C0 are control bits. The data bits D9 to D0 are in straight binary format. Set bits S1 and S0 to zero. All zeros correspond to zero scale and all ones correspond to full scale.

Figure 1. 16-Bit Input Word

Figure 2. Timing Diagram

Digital Inputs

The digital inputs are compatible with CMOS logic. In order to save power and reduce input to output coupling, SCLK and DIN input buffers are powered down immediately after completion of shifting 16 bits into the input shift register. A high to low transition at \overline{CS} powers up SCLK and DIN input buffers.

Applications Information

Unipolar Output

The typical application circuit (Figure 3) shows the MAX5741 configured for a unipolar output, where the output voltages and the reference inputs have the same polarity. Table 3 lists the unipolar output codes.

Bipolar Output

The MAX5741 can be configured for bipolar operation using a dual supply op amp (Figure 4). The transfer function for bipolar operation is:

$$V_{OUT} = V_{REF} \left[\left(\frac{2D}{1024} \right) - 1 \right]$$
