## 3.3V 1:9 High-Performance, Low-Voltage Bus Clock Driver

Precision Edge®

### General Description

The SY89809L is a High-Performance Bus Clock Driver with 9 differential HSTL (High-Speed Transceiver Logic) output pairs. The part is designed for use in low-voltage (3.3V/1.8V) applications, which require a large number of outputs to drive precisely aligned, ultra-low skew signals to their destination. The input is multiplexed from either HSTL or LVPECL (Low-Voltage Positive-Emitter-Coupled Logic) by the CLK\_SEL pin. The Output Enable (OE) is synchronous so that the outputs will only be enabled/disabled when they are already in the LOW state. This avoids any chance of generating a runt clock pulse when the device is enabled/disabled as can happen with an asynchronous control.

The SY89809L features low pin-to-pin skew (50ps max.) and low part-to-part skew (200ps max.)—performance previously unachievable in a standard product having such a high number of outputs. The SY89809L is available in a single space saving package, enabling a lower overall cost solution.

Datasheets and support documentation can be found on Micrel's web site at: [www.micrel.com](http://www.micrel.com).

### Features

- 3.3V core supply, 1.8V output supply for reduced power
- LVPECL and HSTL inputs
- 9 differential HSTL (low-voltage swing) output pairs
- HSTL outputs drive 50Ω-to-ground with no offset voltage
- 500MHz maximum clock frequency
- Low part-to-part skew (200ps max.)
- Low pin-to-pin skew (50ps max.)
- Available in 32-pin TQFP

### Applications

- High-performance PCs
- Workstations
- Parallel processor-based systems
- Other high-performance computing
- Communications

**Notes:**

1. Contact factory for die availability. Dice are guaranteed at T<sub>A</sub> = 25°C, DC Electricals only.
2. Tape and Reel.
3. Pb-Free package is recommended for new designs.

## Pin Configuration

## Pin Description

Pin Number	Pin Name	Type	Pin Function
2, 3	HSTL_CLK, /HSTL_CLK	HSTL Input	Differential input: This HSTL input can be selected by CLK_SEL. If it is not used, it can be left floating. This produces a LOW at the output. If driven by an HSTL driver, an external 50 $\Omega$ to ground termination is required at the input.
5, 6	LVPECL_CLK, /LVPECL_CLK	LVPECL Input	Differential input: This LVPECL input can be selected by CLK_SEL. If it is not used, it can be left floating. This produces a LOW at the output (internal 75k $\Omega$ pull-downs).
4	CLK_SEL	LVTTL Input	Selected HSTL_CLK input when LOW and LVPECL_CLK output when HIGH. 11k $\Omega$ pull-up.
8	OE	LVTTL Input	Single-ended input: This LVTTL input disables and enables the Q0-Q8 output pairs. It is internally synchronized to prevent glitching of the Q0-Q8 output pairs. It is internally connected to a 11k $\Omega$ pull-up resistor and will default to a logic HIGH state if left open.
31, 29, 27, 23, 21, 19, 15, 13, 11	Q0 – Q8	HSTL Output	Differential clock outputs from HSTL_CLK when CLK_SEL = LOW and LVPECL outputs when CLK_SEL = HIGH. HSTL outputs must be terminated with 50 $\Omega$ to GND. Q0-Q8 outputs are static LOW when OE = LOW. Unused output pairs may be left floating.
30, 28, 26, 22, 20, 18, 14, 12, 10	/Q0 – /Q8	HSTL Output	Differential clock outputs from HSTL_CLK when CLK_SEL = LOW and LVPECL outputs when CLK_SEL = HIGH. HSTL outputs must be terminated with 50 $\Omega$ to GND. /Q0-/Q8 outputs are static HIGH when OE = LOW. Unused output pairs may be left floating.
1	VCCI	VCC Core Power	Core V <sub>CC</sub> connected to 3.3V supply. Bypass with 0.1 $\mu$ F in parallel with 0.01 $\mu$ F low ESR capacitors as close to V <sub>CCI</sub> pin as possible.
9, 16, 17, 24, 25, 32	VCCO	VCC Output Power	Output Buffer VCC connected to 1.8V supply. Bypass with 0.1 $\mu$ F in parallel with 0.01 $\mu$ F low ESR capacitors as close to V <sub>CCO</sub> pins as possible. All V <sub>CCO</sub> pins should be connected together on the PCB.
7	GND	Ground	Ground.

### Notes:

- Outputs loaded with  $50\Omega$  to ground. Airflow  $\geq 300$ lfpm.
- Differential propagation delay is defined as the delay from the crossing point of the differential input signals to the crossing point of the differential output signals.
- Output swing greater than 450mV.
- The within-device skew is defined as the worst-case difference between any two similar delay paths within a single device operating at the same voltage and temperature.
- The part-to-part skew is defined as the absolute worst-case difference between any two delay paths on any two devices operating at the same voltage and temperature.
- The  $V_{PP}(\text{min})$  is defined as the minimum input differential voltage which will cause no increase in the propagation delay.
- $V_{CMR}$  is defined as the range within which the  $V_{IH}$  level may vary with the device still meeting the propagation delay specification. The numbers in the table are referenced to  $V_{CCI}$ . The  $V_{IL}$  level must be such that the peak-to-peak voltage is less than 1.0V and greater than or equal to  $V_{PP}(\text{min})$ .
- OE set-up time is defined with respect to the rising edge of the clock. OE HIGH-to-LOW transition ensures outputs remain disabled during the next clock cycle.

### Package Information

**NOTES:**

1. DIMENSIONS ARE IN MM(INCHES).
2. CONTROLLING DIMENSION: MM.
3. DIMENSION DOES NOT INCLUDE MOLD FLASH OR PROTRUSIONS, EITHER OF WHICH SHALL NOT EXCEED 0.254 [0.010].
4. LEAD DIMENSION DOES NOT INCLUDE DAMBAR PROTRUSION.
5. MAXIMUM AND MINIMUM SPECIFICATIONS ARE INDICATED AS FOLLOWS: MAX/MIN.
6. THESE DIMENSIONS TO BE DETERMINED AT DATUM PLANE  $\square$ -H-
7. PACKAGE TOP DIMENSIONS ARE SMALLER THAN BOTTOM DIMENSIONS AND TOP OF PACKAGE WILL NOT OVERHANG BOTTOM OF PACKAGE.
