

June 1989

2K x 8 CMOS PROM

Features

- This Circuit is Processed in Accordance to MIL-STD-883 and is Fully Conformant Under the Provisions of Paragraph 1.2.1.
- Low Power Standby and Operating Power
 - ▶ ICCSB 100 μ A
 - ▶ ICCOP 20mA at 1MHz
- Fast Access Time 90/120ns
- Industry Standard Pinout
- Single 5.0 Volt Supply
- CMOS/TTL Compatible Inputs
- High Output Drive 12 LSTTL Loads
- Synchronous Operation
- On-Chip Address Latches
- Separate Output Enable
- Operating Temperature Range -55 $^{\circ}$ C to +125 $^{\circ}$ C

Description

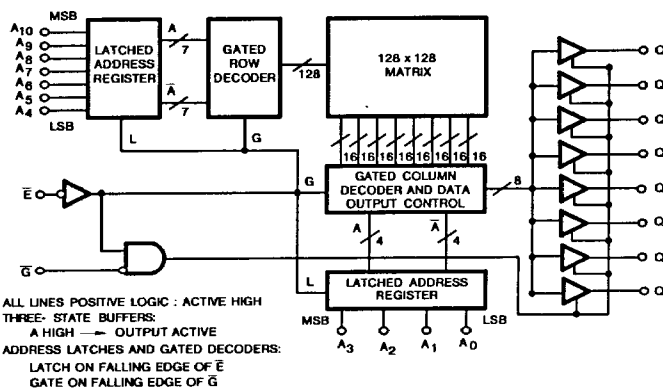

The HM-6617/883 is a 16,384 bit fuse link CMOS PROM in a 2K word by 8 bit/word format with "Three-State" outputs. This PROM is available in the standard 0.600 inch wide 24 pin Ceramic DIP, the 0.300 inch wide slimline Ceramic DIP, and the JEDEC standard 32 pad Ceramic LCC.

The HM-6617/883 utilizes a synchronous design technique. This includes on-chip address latches and a separate output enable control which makes this device ideal for applications utilizing recent generation microprocessors. This design technique, combined with the Harris advanced self-aligned silicon gate CMOS process technology offers ultra-low standby current. Low ICCSB is ideal for battery applications or other systems with low power requirements.

The Harris NiCr fuse link technology is utilized on this and other Harris CMOS PROMs. This gives the user a PROM with permanent, stable storage characteristics over the full industrial and military temperature voltage ranges. NiCr fuse technology combined with the low power characteristics of CMOS provides an excellent alternative to standard bipolar PROMs or NMOS EPROMs.

All bits are manufactured storing a logical "0" and can be selectively programmed for a logical "1" at any bit location.

Functional Diagram

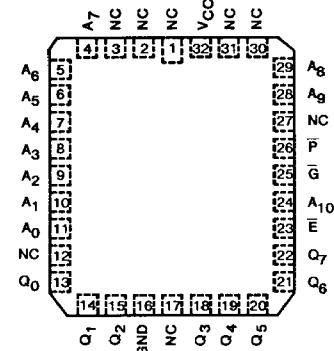

Pinouts

TOP VIEW

HM4-6617/883 (CERAMIC LCC)
TOP VIEW

PIN	DESCRIPTION
NC	No Connect
A ₀ - A ₁₀	Address Inputs
\bar{E}	Chip Enable
Q	Data Input
VCC	Power (+5V)
\bar{G}	Output Enable
\bar{P}^*	Program Enable

* \bar{P} Should be Hardwired to VCC Except During Programming

Specifications HM-6617/883

Absolute Maximum Ratings

Supply Voltage (All Voltages Reference to Device GND) +7.0V
 Input or Output Voltage Applied for all Grades GND-0.3V to $V_{CC}+0.3V$
 Storage Temperature Range -65°C to +150°C
 Lead Temperature (Soldering 10 sec) +300°C
 Junction Temperature +175°C
 ESD Classification Class 1
 Typical Derating Factor 5mA/MHz Increase in ICCOP

Reliability Information

Thermal Resistance θ_{ja} θ_{jc}
 Ceramic DIP Package 48°C/W 9°C/W
 Ceramic LCC Package 58°C/W 19°C/W
 Maximum Package Power Dissipation at +125°C
 Ceramic DIP Package 1.0W
 Ceramic LCC Package 0.86W
 Gate Count 5473 Gates

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

Operating Conditions

Operating Supply Voltage (V_{CC}) 4.5V to 5.5V Input Low Voltage (V_{IL}) -0.3V to +0.8V
 Operating Temperature (T_A) -55°C to +125°C Input High Voltage (V_{IH}) +2.4V to $V_{CC}+0.3V$

NOTES:

- All inputs must track V_{CC} (pin 24) within these limits.
- V_{CCPROG} must be capable of supplying 500mA.
- See Steps 22 through 29 of the Programming Algorithm.
- See Step 11 of the Programming Algorithm.
- All outputs should be pulled up to V_{CC} through a resistor of value R_n .
- Except during programming (See Programming Cycle Waveforms).

DESIGN INFORMATION (Continued)

The information contained in this section has been developed through characterization by Harris Semiconductor and is for use as application and design aid only. These characteristics are not 100% tested and no product guarantee is implied.

Background Information Programming Algorithm

The HM-6617 CMOS PROM is manufactured with all bits containing a logical zero (output low). Any bit can be programmed selectively to a logical one (output high) state by following the procedure shown below. To accomplish this, a programmer can be built that meets the specifications shown, or any of the approved commercial programmers can be used.

PROGRAMMING SEQUENCE OF EVENTS

- 1) Apply a voltage of V_{CC1} to V_{CC} of the PROM.
- 2) Read all fuse locations to verify that the PROM is blank (output low).
- 3) Place the PROM in the initial state for programming:
 $\bar{E} = V_{IH}$, $\bar{P} = V_{IH}$, $\bar{G} = V_{IL}$.
- 4) Apply the correct binary address for the word to be programmed. No inputs should be left open circuit.
- 5) After a delay of t_{d} , apply voltage of V_{IL} to \bar{E} (pin 18) to access the addressed word.
- 6) The address may be held through the cycle, but must be held valid at least for a time equal to t_{d} after the falling edge of \bar{E} . None of the inputs should be allowed to float to an invalid logic level.
- 7) After a delay of t_{d} , disable the outputs by applying a voltage of V_{IH} to \bar{G} (pin 20).
- 8) After a delay of t_{d} , apply voltage of V_{IL} to \bar{P} (pin 21).
- 9) After delay of t_{d} , raise V_{CC} (pin 24) to V_{CCPROG} with a rise time of t_r . All outputs at V_{IH} should track V_{CC} with $V_{CC}-2.0V$ to $V_{CC}+0.3V$. This could be accomplished by pulling outputs at V_{IH} to V_{CC} through pull-up resistors of value R_n .
- 10) After a delay of t_{d} , pull the output which corresponds to the bit to be programmed to V_{IL} . Only one bit should be programmed at a time.
- 11) After a delay of t_{pw} , allow the output to be pulled to V_{IH} through pull-up resistor R_n .
- 12) After a delay of t_{d} , reduce V_{CC} (pin 24) to V_{CC1} with a fall time of t_f . All outputs at V_{IH} should track V_{CC} with $V_{CC}-2.0V$ to $V_{CC}+0.3V$. This could be accomplished by pulling outputs at V_{IH} to V_{CC} through pull-up resistors of value R_n .
- 13) Apply a voltage of V_{IH} to \bar{P} (pin 21).
- 14) After a delay of t_{d} , apply a voltage of V_{IL} to \bar{G} (pin 20).
- 15) After a delay of t_{d} , examine the outputs for correct data. If any location verifies incorrectly, repeat steps 4 through 14 (attempting to program only those bits in the word which verified incorrectly) up to a maximum of eight attempts for a given word. If a word does not program within eight attempts, it should be considered a programming reject.
- 16) Repeat steps 3 through 15 for all other bits to be programmed in the PROM.

POST-PROGRAMMING VERIFICATION

- 17) Place the PROM in the post-programming verification mode:
 $\bar{E} = V_{IH}$, $\bar{G} = V_{IL}$, $\bar{P} = V_{IH}$, V_{CC} (pin 24) = V_{CC1} .
- 18) Apply the correct binary address of the word to be verified to the PROM.
- 19) After a delay of t_{d} , apply a voltage of V_{IL} to \bar{E} (pin 18).
- 20) After a delay of t_{d} , examine the outputs for correct data. If any location fails to verify correctly, the PROM should be considered a programming reject.
- 21) Repeat steps 17 through 20 for all possible programming locations.

POST-PROGRAMMING READ

- 22) Apply a voltage of $V_{CC2} = 4.0V$ to V_{CC} (pin 24).
- 23) After a delay of t_{d} , apply a voltage of V_{IH} to \bar{E} (pin 18).
- 24) Apply the correct binary address of the word to be read.
- 25) After a delay of t_{d} , apply a voltage of V_{IL} to \bar{E} (pin 18).
- 26) After a delay of t_{d} , examine the outputs for correct data. If any location fails to verify correctly, the PROM should be considered a programming reject.
- 27) Repeat steps 23 through 26 for all address locations.
- 28) Apply a voltage of $V_{CC2} = 6.0V$ to V_{CC} (pin 24).
- 29) Repeat steps 23 through 26 for all address locations.

DESIGN INFORMATION (Continued)

The information contained in this section has been developed through characterization by Harris Semiconductor and is for use as application and design aid only. These characteristics are not 100% tested and no product guarantee is implied.
