Description

The IDT71024 is a 1,048,576-bit high-speed static RAM organized as 128K x 8. It is fabricated using IDT's high-performance, high-reliability CMOS technology. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost-effective solution for high-speed memory needs.

The IDT71024 has an output enable pin which operates as fast as 6ns, with address access times as fast as 12ns available. All bidirectional inputs and outputs of the IDT71024 are TTL-compatible, and operation is from a single 5V supply. Fully static asynchronous circuitry is used; no clocks or refreshes are required for operation.

The IDT71024 is packaged in 32-pin 300 mil Plastic SOJ and 32-pin 400 mil Plastic SOJ.

Timing Waveform of Read Cycle No. 1⁽¹⁾

2964 drw 05

Timing Waveform of Read Cycle No. 2^(1,2,4)

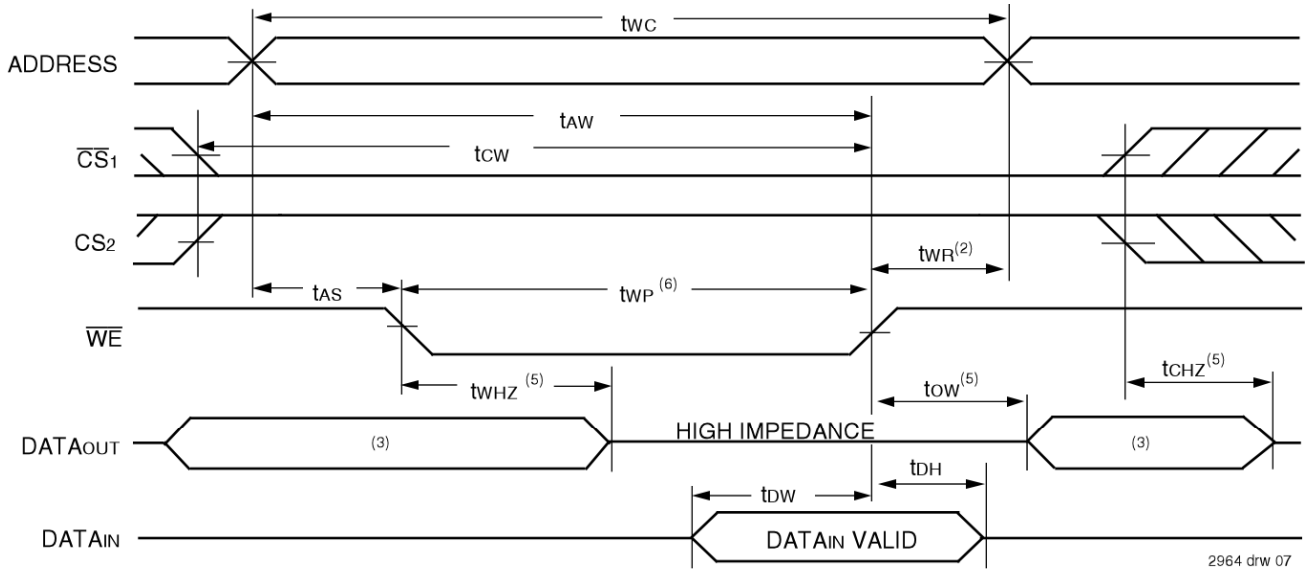

2964 drw 06

NOTES:

1. \overline{WE} is HIGH for Read Cycle.
2. Device is continuously selected, $\overline{CS1}$ is LOW, CS2 is HIGH.
3. Address must be valid prior to or coincident with the later of $\overline{CS1}$ transition LOW and CS2 transition HIGH; otherwise t_{AA} is the limiting parameter.
4. \overline{OE} is LOW.
5. Transition is measured $\pm 200\text{mV}$ from steady state.

Timing Waveform of Write Cycle No. 1 (\overline{WE} Controlled Timing)^(1,4,6)

2964 drw 07

Timing Waveform of Write Cycle No. 2 ($\overline{CS1}$ AND CS2 Controlled Timing)^(1,4)

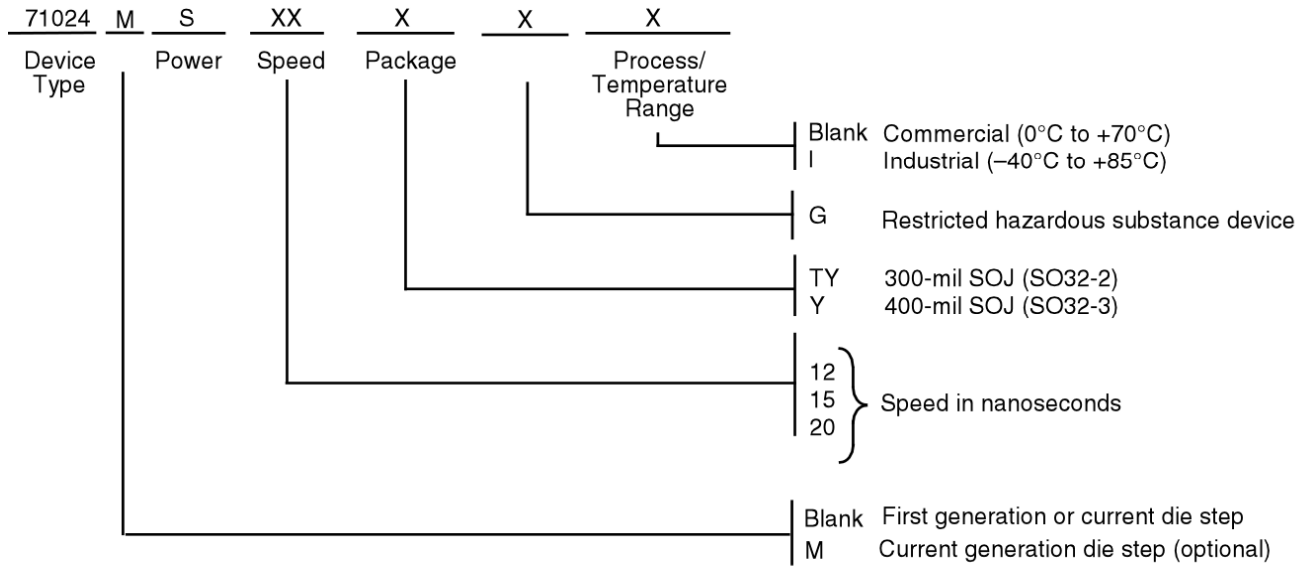

2964 drw 08

NOTES:

1. A write occurs during the overlap of a LOW $\overline{CS1}$, HIGH CS2, and a LOW \overline{WE} .
2. t_{WR} is measured from the earlier of either $\overline{CS1}$ or \overline{WE} going HIGH or CS2 going LOW to the end of the write cycle.
3. During this period, I/O pins are in the output state, and input signals must not be applied.
4. If the $\overline{CS1}$ LOW transition or the CS2 HIGH transition occurs simultaneously with or after the \overline{WE} LOW transition, the outputs remain in a high impedance state. $\overline{CS1}$ and CS2 must both be active during the t_{CW} write period.
5. Transition is measured $\pm 200mV$ from steady state.
6. \overline{OE} is continuously HIGH. During a \overline{WE} controlled write cycle with \overline{OE} LOW, t_{WP} must be greater than or equal to $t_{WHZ} + t_{DW}$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{OW} . If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the minimum write pulse is the specified t_{WP} .
