

# TPS2661x: 50-V, Universal 4–20 mA, $\pm 20$ -mA Current Loop Protector With Input and Output Miswiring Protection

## 1 Features

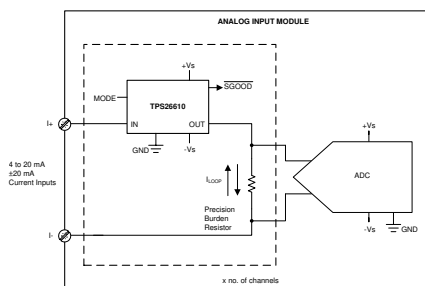

- $\pm 50$ -V operating voltage,  $\pm 55$ -V absolute maximum
- Integrated fixed bipolar 32-mA current limit
- Allows 2x current limit at start-up
- 50% space savings compared to a typical discrete protection circuit
- Low R-on: 7.5- $\Omega$  typical
- Low  $I_Q$  ( $< 100$  nA) – current drawn from loop when powered from external supply
- Protection against miswiring conditions on IN and OUT
- Protection during signal line surge IEC61000-4-5 (with external TVS)
- Criteria-A EFT (IEC61000-4-4) immunity (with external TVS)
- Supports loop testing without supply (TPS26610 only)
- HART compliant
- Enable control
- $\overline{SGOOD}$  for system health monitoring
- Thermal shutdown

## 2 Applications

- [Factory automation and control](#) – PLCs - analog input and output module
- Motor drives control
- HART inputs
- [HVAC controllers](#)
- UART IO protection
- Thermal controller

## 3 Description

The TPS2661x is a compact, feature-rich, fully integrated current loop protector suitable for analog inputs, analog outputs, sensor transmitters, HART inputs, and UART IO protection. The device provides

Typical Circuit Schematic

universal input protection for  $\pm 20$  mA, 0 mA to 20 mA, and 4 mA–20 mA. Low  $R_{ON}$  values of 7.5  $\Omega$  minimizes drop in the current loop, thereby extending operating range and supporting operation even with lower voltage power supplies. The device can withstand and protect the loads from positive and negative supply voltages up to  $\pm 50$  V. The MODE pin allows flexibility to enable 2x current limit through the device to enable proper start-up of two wire transmitters. Device is capable of operating from an external bipolar supply as low as  $\pm 2.25$  V to  $\pm 20$  V. The device can also be powered from unipolar supplies as low as 3 V to 30 V. The TPS26610 and TPS26613 feature loop power mode to facilitate loop testing in un-powered state without  $\pm V_s$  supplies.

The device also protects the system from output side miswiring in analog outputs and sensor transmitters by turning off the current path. The internal robust protection control blocks along with the 50-V rating of the TPS2661x help to protect against surge (IEC61000-4-5) and EFT (IEC61000-4-4) transients for signal lines. The device greatly reduces system footprint by its 2.9-mm  $\times$  1.6-mm 8-pin SOT-23 package.

### Device Information<sup>(1)</sup>

## 6 Pin Configuration and Functions

Figure 6-1. TPS26610 and TPS26613 DDF Package 8-Pin SOT-23 (Top View)

Figure 6-2. TPS26611, TPS26612, and TPS26614 DDF Package 8-Pin SOT-23 (Top View)

Table 6-1. Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
GND	1	—	Reference ground for all internal voltages. Connect to GND of the $\pm V_s$ supply.
MODE	2	I	MODE selection pin for overload response. Sets current limit to $I_{OL}$ , $2 \times I_{OL}$ , or $2 \times I_{OL}$ with extended $I_{OL}$ expiry time. See the <a href="#">Device Functional Modes</a> for details.
$-V_s$	3	P	Negative supply for dual supply configurations. Connect to GND when used in a single supply configuration.
IN	4	P	Signal/power input
OUT	5	P	Signal/power output
$+V_s$	6	P	Positive supply for powering the device
EN	7	I	<i>For the TPS26611, TPS26612, and TPS26614:</i> Enable control. Pull EN low to turn off the device. EN has internal an pullup and it can be left floating to enable the device.
VSNS		I	<i>For the TPS26610 and TPS26613:</i> Supply sensing input for transition to loop power mode. If not used, this pin can be left open or floating.
$\overline{\text{SGOOD}}$	8	O	Signal good indicator pin. Whenever the device is within normal operating condition, $\overline{\text{SGOOD}}$ shows low indicating signal is good to read. This pin can also be used to drive an external LED to give a visual indication about the state of system.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
IN, OUT, IN-OUT		-55	55	V
$\overline{\text{SGOOD}}$ , EN, MODE, VSNS		-0.3	5.5	V
+Vs		-0.3	32	V
-Vs		-22	0.3	V
$I_{\text{MODE}}$ , $I_{\overline{\text{SGOOD}}}$ , $I_{\text{EN}}$	Source Current	Internally Limited		
$I_{\text{EN}}$	Sink Current	Internally Limited		
$I_{\overline{\text{SGOOD}}}$			200	$\mu\text{A}$
$T_{\text{J}}$	Operating Junction temperature	-40	150	°C
	Transient Junction temperature	-65	$T_{(\text{TSD})}$	
$T_{\text{stg}}$	Storage temperature	-65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

			VALUE	UNIT
$V_{(\text{ESD})}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins <sup>(1)</sup>	$\pm 2000$	V
		Charged device model (CDM), per ANSI/ESDA/ JEDEC JS-002, all pins <sup>(2)</sup>	$\pm 750$	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
IN, OUT	Voltage	-50		50	V
+Vs,	Supply Voltage	0		30	
-Vs		-20		0	V
EN, $\overline{\text{SGOOD}}$ , VSNS	Voltage	0		5	V
MODE		0		3	V
$T_{\text{J}}$	Operating Junction temperature	-40		125	°C

### 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS2661		UNIT
		DDF (SOT-23-THN)		
		8 PINS		
$R_{\theta\text{JA}}$	Junction-to-ambient thermal resistance	117.8		°C/W
$R_{\theta\text{JC(top)}}$	Junction-to-case (top) thermal resistance	57.6		°C/W
$R_{\theta\text{JB}}$	Junction-to-board thermal resistance	40.2		°C/W
$\Psi_{\text{JT}}$	Junction-to-top characterization parameter	2.2		°C/W

## 7.4 Thermal Information (continued)

THERMAL METRIC <sup>(1)</sup>		TPS2661	UNIT
		DDF (SOT-23-THN)	
		8 PINS	
$\Psi_{JB}$	Junction-to-board characterization parameter	40	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 8 Detailed Description

### 8.1 Overview

The TPS2661x is a family of devices providing complete protection for current inputs, voltage inputs/outputs, and sensor supply in industrial and process automation systems. The device supports both unipolar 4-mA to 20-mA current loops and bipolar  $\pm 20$ -mA current loops. The TPS26610 and TPS26613 are tailored for current inputs. The device can be powered from an external supply and draws  $< 100$ -nA maximum current from the current loop enabling design of high accuracy analog input systems. The devices feature an accurate 32-mA current limit, which enables using low power components in the loop like the sense resistors, which reduces the overall system size and cost. The TPS26611 and TPS26614 are specifically tailored for universal current inputs and voltage/current multiplexed inputs while the TPS26612 is tailored for protection of two wire sensor transmitters. The TPS2661x devices feature a configurable MODE pin to allow higher current for powering up of a variety of two wire transmitters. The TPS26611 also has enable control for designing V/I multiplexed analog inputs or universal analog input-output modules. The device also features a signal-good output to indicate if there is a valid current input. The signal good pin goes high in the event of any fault or during start-up of the system if there is an inrush current. The device also protects the system from output miswiring in analog output modules or sensor transmitters by cutting off the current path if the OUT pin goes outside the  $+/-V_s$  supply rails.

The robust protection of the TPS2661x along with its  $\pm 50$ -V rating helps to simplify the system designs for surge compliance. The TPS2661x devices are immune to noise tests like electrical fast transients that are common in industrial applications. These devices also simplify the system design for protection from surge transients (IEC61000-4-5).

## 8.3 Feature Description

### 8.3.1 Overload Protection and Fast-Trip

The TPS2661x devices feature a fixed  $I_{OL}$  value of 32-mA typical, bidirectional current limit. For use in unipolar systems like 4–20-mA current loops where negative current is not desired, connect  $-V_s$  to GND to cut off when there is a flow of reverse current (OUT to IN). If the current tries to exceed the  $I_{OL}$  limit, the device regulates the current, eventually reducing the output voltage. Overload current threshold and time for overload protection can be selected by the MODE pin. See [Device Functional Modes](#) for details. The power dissipation across the device during current regulation is  $(V_{IN} - V_{OUT}) \times I_{OUT}$ , which can heat up the device and lead to thermal shutdown. After thermal shutdown, the device goes into auto retry. The mode pin selects the auto retry period. See [Table 8-3](#) and [Figure 8-24](#) for selection of the auto retry period.

The TPS2661x devices also feature a fast-trip comparator. During fast transient events like output short circuit, miswiring, hotplug, and so forth, the current through the device increases rapidly. Due to limited bandwidth, the current limit amplifier cannot respond quickly to these events. Hence, the fast-trip comparator architecture is included for fast turn OFF of the internal FET during these events. The device turns off the internal FETs within a time of  $t_{(FASTTRIP)}$ . See the [Timing Requirements](#) for  $t_{(FASTTRIP)}$ . The fast-trip circuit holds the internal FET off for a short duration (50  $\mu$ s), after which, the device turns back on slowly, allowing the current-limit loop to regulate the output current to current limit as per MODE pin configuration. [Figure 8-5](#) and [Figure 8-7](#) illustrate the current limit behavior of TPS2661x devices. [Figure 8-8](#) illustrates the fast-trip protection of TPS2661x devices and [Figure 8-9](#) illustrates the auto-retry behavior in overload fault.

Figure 8-7. Current Limit Behavior for I<sub>OUT</sub> > 2 × I<sub>OL</sub> with MODE = 180 kΩ

Figure 8-8. Fast-Trip Behavior

Figure 8-9. Auto-Retry Behavior

### 8.3.2 Reverse Current Blocking for Unipolar Current Inputs TPS26610, TPS26611 and TPS26612 (4–20 mA, 0–20 mA)

For reverse current blocking with TPS26610, TPS26611 and TPS26612 devices, connect burden resistor to GND and use single supply (+Vs, GND) with the device as shown in Figure 8-10. In this configuration, the device blocks the reverse current (OUT to IN) when IN pin voltage is negative.

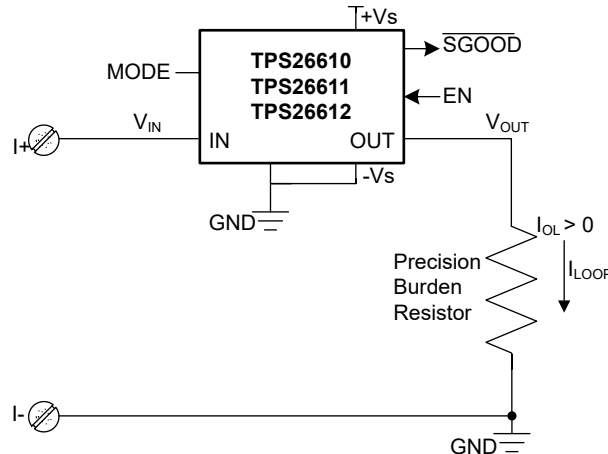

Figure 8-10. Reverse Current Blocking for Unipolar Current Inputs With TPS26610, TPS26611 and TPS26612

### 8.3.3 OUTPUT and INPUT Cutoff During Overvoltage, Undervoltage Due to Miswiring

Table 8-1 summarizes the output and input cutoff present in TPS2661 devices

Table 8-1. Output and Input Miswiring Protection in TPS2661 Devices

Device	Output Overvoltage	Output Undervoltage	Input Undervoltage
TPS26610	Y	Y	Y
TPS26611	Y	Y	Y
TPS26612	Y	Y	Y
TPS26613	Y	Y	N
TPS26614	Y	Y	N

### 8.3.3.1 Output Overvoltage With TPS2661x Devices

The TPS2661x devices provide protection from overvoltage events on OUT pin by turning off the internal pass FETs and cutting off the signal path whenever  $V_{OUT}$  goes above  $V_{OUT\_OVLO}$  threshold. The signal path through TPS2661x is restored again when  $V_{OUT}$  goes below  $[V_{OUT\_OVLO} - V_{OUT\_OVLO\_Hyst}]$  value. The device turns off the internal FETs within a time of  $t_{OUT\_OV\_CUT}$  after output voltage has gone above  $V_{OUT\_OVLO}$  threshold. See Timing Requirements in Specifications for  $t_{OUT\_OV\_CUT}$ . The device recovers from output overvoltage within a time of  $t_{OUT\_CUT\_Rec}$  after output voltage has gone below  $[V_{OUT\_OVLO} - V_{OUT\_OVLO\_Hyst}]$  value. See the [Timing Requirements](#) in Specifications for  $t_{OUT\_OV\_CUT}$ . Figure 8-11 illustrates the output overvoltage protection in TPS2661x devices.

Figure 8-11. Output Overvoltage Protection

### 8.3.3.2 Output or Input Undervoltage With TPS26610, TPS26611 and TPS26612

TPS26610, TPS26611 and TPS26612 devices provide protection from undervoltage events on IN and OUT pins by turning off the internal pass FETs and cutting off the signal path whenever  $V_{OUT}$  or  $V_{IN}$  goes below  $V_{O/I\_UVLO}$  threshold. The signal path through the device is restored again when  $V_{OUT}$  or  $V_{IN}$  goes above  $[V_{O/I\_UVLO} - V_{O/I\_UVLO\_Hyst}]$  value. The device turns off the internal FETs within a time of  $t_{O/I\_UV\_CUT}$  after output or input voltage has gone below  $V_{O/I\_UVLO}$  threshold. The device recovers from output or input undervoltage within a time of  $t_{OUT\_CUT\_Rec}$  after output or input voltage has gone above  $[V_{O/I\_UVLO} - V_{O/I\_UVLO\_Hyst}]$  voltage. See the [Timing Requirements](#) in Specifications for  $t_{O/I\_UV\_CUT}$  and  $t_{OUT\_CUT\_Rec}$ .

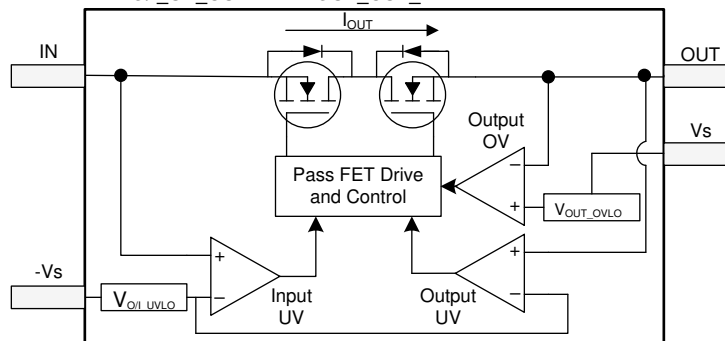

Figure 8-12. Output and Input Undervoltage Cutoff With TPS26610, TPS26611 and TPS26612

In case of overvoltage, undervoltage and miswiring events on IN and OUT pins, voltages exceeding Absolute Maximum Ratings (see [Specifications](#)) for IN and OUT Pins can damage the device. [Figure 8-13](#) and [Figure 8-14](#) illustrate the output and input undervoltage protection in these devices.

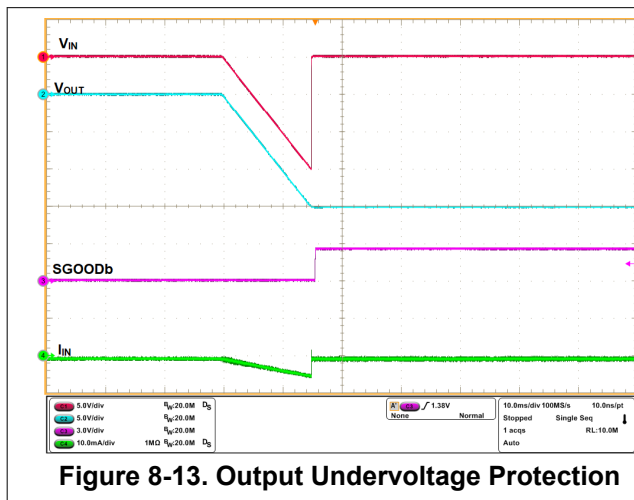

Figure 8-13. Output Undervoltage Protection

Figure 8-14. Input Undervoltage Protection

### 8.3.3.3 Output Undervoltage With TPS26613 and TPS26614

TPS26613 and TPS26614 devices provide protection from undervoltage events OUT pins by turning off the internal pass FETs and cutting off the signal path whenever VOUT goes below  $V_{O\_UVLO}$  threshold. The signal path through the device is restored again when VOUT goes above  $[V_{O\_UVLO} - V_{O\_UVLO\_Hyst}]$  value. The device turns off the internal FETs within a time of  $t_{O\_UV\_CUT}$  after output voltage has gone below  $V_{O\_UVLO}$  threshold. The device recovers from output undervoltage within a time of  $t_{OUT\_CUT\_Rec}$  after output voltage has gone above  $[V_{O\_UVLO} - V_{O\_UVLO\_Hyst}]$  voltage. See the [Timing Requirements](#) in Specifications for  $t_{O\_UV\_CUT}$  and  $t_{OUT\_CUT\_Rec}$ .

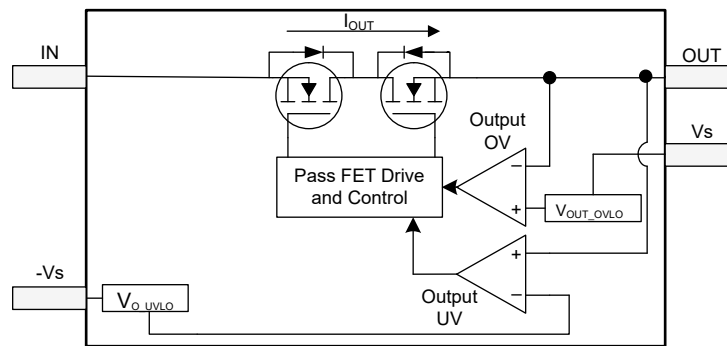

Figure 8-15. Output Undervoltage Cutoff in TPS26613 and TPS26614

### 8.3.4 External Power Supply ( $\pm V_s$ )

The TPS2661x devices are powered from an external  $+V_s/-V_s$  supply. This feature ensures that the TPS2661x does not draw any current from the IN/OUT pins which carry current information. TPS26610 allows current conduction from IN to OUT pins when  $+V_s/-V_s$  supplies are not present. TPS26611 and TPS26612 devices need  $+V_s/-V_s$  or  $+V_s/GND$  for operation.

For systems requiring positive and negative voltage on IN and OUT pins of TPS2661x, use bipolar supplies ( $+V_s$  and  $-V_s$ ) with TPS2661x. Connect positive supply rail to  $+V_s$  and negative supply rail to  $-V_s$  pins. The device supports dual supplies from as low as  $\pm 2.25$  V up to  $\pm 20$  V.

For systems requiring only positive voltage on IN and OUT pins of TPS2661x, use unipolar supply ( $+V_s$  and GND) with TPS2661x. Connect positive supply rail to  $+V_s$ , and  $-V_s$  pin must be connected to GND of device. When powered from single supplies, TPS26610, TPS26611, TPS26613 and TPS26614 devices can be powered from +3 V up to +30 V and TPS26612 can be powered from +4 V up to +30 V.

The device turns on the internal FETs with a delay time of  $t_{ON\_dly}$  after powering up of  $+V_s$  supply and turns off the internal FET with a delay time of  $t_{OFF\_dly}$  after powering down of  $+V_s$  supply. See the [Timing Requirements](#) in Specifications for  $t_{ON\_dly}$  and  $t_{OFF\_dly}$ .

### 8.3.5 Loop Testing Without $\pm V_s$ Supply (Loop Power Mode in TPS26610, TPS26613 Only)

TPS26610 and TPS26613 devices allow a bipolar current limited conduction through the device even when the external  $+V_s/-V_s$  supplies are not there. When the external supply is not there, the device switches to loop power mode and derives its operating power from the 4–20-mA or  $\pm 20$ -mA current loop. This feature enables the field installation engineer to check the wiring of the whole current loop system by passing a test current through the current loop without actually powering on the system. This feature also helps in design of safety critical redundant systems with two redundant measurements for the same current loop. In case power is not available in one system, a second system connected in the loop is still be able to read the current information because the loop is not broken. During loop testing without  $\pm V_s$  supply, the device has a voltage drop of  $V_{(IN-OUT)no\_Vs}$ , the current through device is limited to  $I_{OL\_noVs}$ . During loop testing, the device draws a current of  $I_{OL\_noVs}$  from IN pin. See the [Electrical Characteristics](#) in Specifications for  $V_{(IN-OUT)no\_Vs}$ ,  $I_{qno\_Vs}$  and  $I_{OL\_noVs}$ .

The device provides thermal protection during loop testing, if the power dissipation in device increases above 500 mW (typical), the devices turns off internal FET for short durations to limit the power dissipation. [Figure 8-16](#) and [Figure 8-17](#) illustrate the thermal protection during loop testing.

$+V_s = 15\text{ V}$ ,  $-V_s = -15\text{ V}$ ,  $R_{OUT} = 250\ \Omega$ ,  $V_{IN} = 21\text{ V}$

**Figure 8-16. Thermal Protection During Loop Testing for  $I_{LOOP} > 0$**

$+V_s = 15\text{ V}$ ,  $-V_s = -15\text{ V}$ ,  $R_{OUT} = 250\ \Omega$ ,  $V_{IN} = -21\text{ V}$

**Figure 8-17. Thermal Protection During Loop Testing for  $I_{LOOP} < 0$**

#### 8.3.5.1 Supply Sensing With VSNS for Loop Power Mode With TPS26610 and TPS26613

For the TPS26610 and TPS26613 devices, the set-point for transition to loop power mode can be set by connecting resistors ( $R_1$ ,  $R_2$ ) from  $+V_s$  pin to  $VSNS$  pin and GND pin as shown in [Figure 8-18](#). The set-point can be calculated as per [Table 8-2](#). TI recommends to use resistors  $R_1$  and  $R_2$  for supply sensing when voltage across burden resistor ( $I_{LOOP} \times R_{Burden}$ ) is more than 1.8 V. If  $VSNS$  is left open or floating, the device transitions to loop power mode when  $+V_s$  is less than 1.8 V.

**Table 8-2. Supply Sensing With VSNS for Loop Power Mode**

Device Power Mode	$+V_s$ Voltage
$\pm V_s$ supplies	$+V_s \geq V_{(SNSR)} \times (R_1 + R_2) / R_2^{(1)}$
Loop power	$+V_s \leq V_{(SNSF)} \times (R_1 + R_2) / R_2^{(2)}$

(1) Use  $(R_1 + R_2) \leq (+V_s) / (45\ \mu\text{A})$ . For  $V_{(SNSR)}$  and  $V_{(SNSF)}$  values, see the [Electrical Characteristics](#).

(2) Keep  $V_{(SNSF)} \times (R_1 + R_2) / R_2 > (I_{LOOP} \times R_{Burden})$

Figure 8-18. Supply Sensing With VSNS

Figure 8-19. Transition to Loop Power With R1 = 47 kΩ and R2 = 6.8 kΩ for Supply Sensing

Figure 8-20. Transition to ± Vs Supplies Power with R1 = 47 kΩ and R2 = 6.8 kΩ for supply Sensing

### 8.3.6 Enable Control With TPS26611, TPS26612, and TPS26614

TPS26611, TPS26612, and TPS26614 devices feature an EN pin for externally controlling the device through a GPIO pin. To enable the device, EN pin can be left floating. The pin is internally pulled up with  $V_{(EN)}$ .

EN can also be made high with external voltage more than  $V_{(ENR)}$  but less than or equal to 5 V. The internal FETs are turned off when EN is pulled below  $V_{(ENF)}$ . EN pin can source and sink a current of  $I_{(EN\_LKG)}$ . See [Electrical Characteristics](#) for  $V_{(ENF)}$ ,  $V_{(ENR)}$  and  $I_{(EN\_LKG)}$ . The EN feature helps the system designer to design universal voltage and current analog inputs and outputs where a lot of pin multiplexing options are made available to the end user. For turn-on and turn-off delay with EN pin, see  $t_{ON\_EN\_dly}$  and  $t_{OFF\_EN\_dly}$  in [Timing Requirements](#). [Figure 8-22](#) and [Figure 8-23](#) illustrate the turn-on and turn-off control with enable pin.

Figure 8-21. Enable Control

Figure 8-22. Turn-On With EN Pin

Figure 8-23. Turn-Off With EN Pin

### 8.3.7 Signal Good Indicator ( $\overline{\text{SGOOD}}$ )

The TPS2661x provides an indication of the current signal flowing through pass FETs on the  $\overline{\text{SGOOD}}$  pin. Whenever the device is in normal operating condition, the  $\overline{\text{SGOOD}}$  gives a signal LOW output. However in below cases when the device is outside normal operating condition, the  $\overline{\text{SGOOD}}$  pin goes HIGH:

- Device current is  $> I_{OL}$  (32-mA typical)
- OUT goes outside  $+V_s/-V_s$  supply
- IN goes below  $-V_s$  supply rail (for TPS26610, TPS26611, and TPS26612 only)
- Device shuts down due to thermal limit or current limit

The  $\overline{\text{SGOOD}}$  pin is also capable of driving an external LED to give a visual indication whenever the system is outside normal operating conditions.

The  $\overline{\text{SGOOD}}$  pin sourcing current is derived from  $+V_s$  supply rail. For de-glitch delays in assertion and de-assertion of  $\overline{\text{SGOOD}}$ , see  $T_{SG\_Deglitch}$  in [Timing Requirements](#) in Specifications.

## 8.4 Device Functional Modes

The device can provide higher current up to  $2 \times I_{OL}$  for short durations. MODE pin of the device configures the behavior of the device for higher current. [Table 8-3](#) and [Figure 8-24](#) describe the device behavior in different modes for  $I_{OL} > 0$ .

With MODE = GND, the device limits the current to  $I_{OL}$  value for  $I_{OUT} > I_{OL}$ .

With MODE = OPEN, the device limits the output current as:

- For  $I_{OL} < I_{OUT} < 2 \times I_{OL}$ , the device allows current up to  $2 \times I_{OL}$  for a duration of  $t_{OL\_Pulse\_Expiry}$  and then limits the current to  $I_{OL}$  value for a duration  $t_{OL\_Expiry}$ .

- For  $2 \times I_{OL} < I_{OUT} < I_{(FAST RIP)}$ , the device limits the current  $2 \times I_{OL}$  value and for a duration of  $t_{OL\_Pulse\_Expiry}$  and then limits the current to  $I_{OL}$  value for a duration  $t_{OL\_Expiry}$ .

After the completion of  $t_{OL\_Expiry}$  period, the device goes into auto-retry.

With  $MODE = 180\text{ k}\Omega$ , the device limits the output current as:

- For  $I_{OL} < I_{OUT} < 2 \times I_{OL}$ , the device allows current up to  $2 \times I_{OL}$  for a duration of  $t_{OL\_Extend}$  and then limits the current to  $I_{OL}$  value for a duration  $t_{OL\_Expiry}$ .
- For  $2 \times I_{OL} < I_{OUT} < I_{(FAST RIP)}$ , the device limits the current  $2 \times I_{OL}$  value and for a duration of  $t_{OL\_Pulse\_Expiry}$  and then limits the current to  $I_{OL}$  value for a duration  $t_{OL\_Expiry}$ .

After the completion of  $t_{OL\_Expiry}$  period, the device goes into auto-retry. If the device heats up during overload and the device temperature exceeds  $T_{(TSD)}$  value, the device turns off the internal pass FETs. As the device cools down and its temperature goes below  $[T_{(TSD)} - T_{(TSDHyst)}]$  value, the device goes into auto-retry.

**Table 8-3. Device Operation Under Different MODE Configurations for  $I_{OL} > 0$**

MODE Pin Configuration	$I_{OUT} < I_{OL}$ (32 mA)	$I_{OL}$ (32 mA) $< I_{OUT} < 2 \times I_{OL}$ (60 mA)	$2 \times I_{OL}$ (60 mA) $< I_{OUT} < I_{(FAST RIP)}$	Auto-Retry Time
Shorted to GND	Current flows normally	Current limited to $I_{OL}$ for a duration of $t_{OL\_Expiry}$ (100 ms). $t_{OL\_Expiry}$ (100 ms) timer starts when $I_{OUT}$ exceeds $I_{OL}$ .	Current limited to $I_{OL}$ for a duration of $t_{OL\_Expiry}$ (100 ms). $t_{OL\_Expiry}$ (100 ms) timer starts when $I_{OUT}$ exceed $I_{OL}$ .	$t_{RETRY1}$ (800 ms)
Open	Current flows normally	Device allows current for $t_{OL\_Pulse\_Expiry}$ (50 ms) time after which it is limited to $I_{OL}$ for $t_{OL\_Expiry}$ (100 ms) time and then auto retry. $t_{OL\_Pulse\_Expiry}$ (50 ms) timer starts when $I_{OUT}$ exceeds $I_{OL}$ .	Current limited to $2 \times I_{OL}$ for $t_{OL\_Pulse\_Expiry}$ (50 ms) time after which it is limited to $I_{OL}$ for $t_{OL\_Expiry}$ (100 ms) time and then auto retry. $t_{OL\_Pulse\_Expiry}$ (50 ms) timer starts when $I_{OUT}$ exceeds $I_{OL}$ .	$t_{RETRY1}$ (800 ms)
180 k $\Omega$ from MODE to GND	Current flows normally	Device allows current for $t_{OL\_Extend}$ (5 s) time after which it is limited to $I_{OL}$ for $t_{OL\_Expiry}$ (100 ms) time and then auto retry. $t_{OL\_Extend}$ (5 s) timer starts when $I_{OUT}$ exceeds $I_{OL}$ .	Current limited to $2 \times I_{OL}$ for $t_{OL\_Pulse\_Expiry}$ (50 ms) time after which it is limited to $I_{OL}$ for $t_{OL\_Expiry}$ (100 ms) time and then auto retry. $t_{OL\_Pulse\_Expiry}$ (50ms) timer starts when $I_{OUT}$ exceeds $I_{OL}$ .	$t_{RETRY2}$ (1.6 s)

Case A:  
 $I_{OUT} < I_{OL}$

Case B:  
 $I_{OL} < I_{OUT} < 2 \times I_{OL}$

Case C:  
 $2 \times I_{OL} < I_{OUT} < I_{FASTRIP}$

**Figure 8-24. Device Operation Under Different MODE Configurations for  $I_{OL} > 0$**

Table 8-4 and Figure 8-25 describe the device behavior in different modes for  $I_{OL} < 0$ .

**Table 8-4. Device Operation Under Different MODE Configurations for  $I_{OL} < 0$**

MODE Pin Configuration	$I_{OUT} > -I_{OL}$ (-32 mA)	$-2 \times I_{OL}$ (-60 mA) $< I_{OUT} < -I_{OL}$ (-32 mA)	$-I_{(FASTRIP)} < I_{OUT} < -2 \times I_{OL}$ (-60 mA)	Auto-Retry Time
Shorted to GND or Open or 180 kΩ from MODE to GND	Current flows normally	Current limited to $I_{OL}$ for a duration of $t_{OL\_Expiry}$ (100 ms). $t_{OL\_Expiry}$ (100 ms) timer starts when $I_{OUT}$ exceeds $I_{OL}$ .	Current limited to $I_{OL}$ for a duration of $t_{OL\_Expiry}$ (100ms). $t_{OL\_Expiry}$ (100ms) timer starts when $I_{OUT}$ exceed $I_{OL}$ .	$t_{RETRY1}$ (800 ms)

**Figure 8-25. Device Operation Under Different MODE Configurations for  $I_{OL} < 0$**

## 9 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

The TPS2661x is an industrial current loop protector, providing a robust signal line protection in a wide range of industrial and automation systems. It is suitable for protection of all kinds of current loops like the 4–20-mA or  $\pm 20$ -mA current loops. TPS26610 is suitable for protection in current inputs whereas TPS26611 is suitable for protection in multiplexed V/I inputs.

TPS26612 is suitable for protection in power supply of two wire current transmitters. With disabled auto-retry time for first overload event, TPS26612 enables startup of power hungry transmitters requiring higher start up current for longer durations.

TPS26611 and TPS26612 devices can be also used to protect voltage outputs or digital communication signals like UART from miswiring of power supplies at these outputs. The device breaks the signal path by turning off the FETs when there is a voltage higher than supply voltage and thus keeping the system protected.

TPS2661x provides complete protection from industrial surge transients (IEC61000-4-5) and provides immunity from industrial fast transients (IEC61000-4-4) for signal lines.

### 9.2 Typical Application: Analog Input Protection for Current Inputs with TPS26610

**Figure 9-1. Current Input Protection in AI Module**

A. TVS Diodes D1\*, D2\* are required for protection from surge transients (IEC61000-4-5) when burden resistor is floating (SW1 = Open).

TPS26610 can be used for protection of current inputs in an Analog Input module as shown in Figure 9-1. The current signal is measured by ADC across  $R_{burden}$ . Bipolar current limit of  $\pm 32$  mA ensures that the precision burden resistor as well as the ADC front end stays well protected against any unwanted voltages or currents caused due to faulty transmitter or miswiring. High Voltage rating of IN pin of TPS26610 ensures that it also

protects the system from surge and EFT events as well. For reverse current blocking (OUT to IN), connect burden resistor to GND (SW1 = Closed) and used single supply (+Vs,GND) with TPS26610.

### 9.2.1 Design Requirements

Table 3 shows the design requirements for current input protection with TPS26610.

**Table 9-1. Design Requirements**

DESIGN PARAMETER		EXAMPLE VALUE
$I_{(IN)}$	Input current	$\pm 20$ mA
$V_{(IN)}$	Input voltage	$-V_s$ to 50 V
$V_{(OUT)}$	Output voltage	$\pm V_s$
$I_{(LIM)}$	Current limit	$\pm 30$ mA
$R_{Burden}$	Burden resistance	50 to 250 $\Omega$

### 9.2.2 Detailed Design Procedure for Current Inputs with TPS26610

#### 9.2.2.1 Selecting $\pm V_s$ Supplies for TPS26610

Select the  $\pm V_s$  supplies for TPS2661x devices higher than absolute analog input voltage for ADC inputs.

TPS2661x devices have undervoltage and overvoltage protection on OUT pin and the internal FETs are turned off if OUT pin has voltage higher than +Vs or lower than -Vs.

TPS2661x devices also have undervoltage protection on IN pin and the internal FETs are turned off if IN pin has a voltage lower than -Vs. See [External Power Supply](#) for using unipolar or bipolar supply with TPS2661x.

#### 9.2.2.2 Selecting $R_{Burden}$

The value of  $R_{burden}$  must be selected to meet the analog the input range of the ADC for the loop current range. In case of miswiring faults to field supplies, the maximum current and power dissipated in  $R_{burden}$  is decided by MODE configuration of TPS26610 device.

**Table 9-2. Selection of  $R_{burden}$**

$R_{burden}$ ( $\Omega$ )	MODE Configuration	Maximum Current in $R_{burden}$ (mA)	Maximum Power Dissipated in $R_{burden}$ (mW)
50	MODE = GND	40	80
100	MODE = GND	40	160
250	MODE = GND	40	400
50	MODE = OPEN or 180 k $\Omega$	70	245 <sup>(1)</sup>
100	MODE = OPEN or 180 k $\Omega$	70	490 <sup>(1)</sup>
250	MODE = OPEN or 180 k $\Omega$	70	1225 <sup>(1)</sup>

(1) Power dissipated only for a pulse duration of 50 ms

#### 9.2.2.3 Selecting MODE Configuration for TPS26610

For minimum power dissipation in burden resistor, use MODE = GND. See [Device Functional Modes](#) for selecting the mode configuration.

### 9.2.3 Application Performance Plots for Current Inputs with TPS26610

Figure 9-2. Current Limiting with MODE = GND,  $R_{burden} = 50 \Omega$

Figure 9-7. Reverse Current blocking with VIN = -12 V,  $-V_S = \text{GND}$  and SW1 = Closed

### 9.3 Typical Application: Analog Input Protection for Multiplexed Current and Voltage Inputs with TPS26611

**Figure 9-8. Protection for Multiplexed V/I Inputs in AI Module**

- A. Bias Resistors R1\*, R2\* are required for setting the common mode voltage for voltage input (EN = 0) when burden resistor is floating (SW1 = Open).
- B. Diodes D1\*, D2\* are required surge protection when burden resistor is floating (SW1 = Open).

TPS26611 can be used for protection of multiplexed inputs in an Analog Input module as shown in [Figure 9-8](#). For this configuration, connect the IN pin of TPS26611 to one channel of the ADC for voltage measurement and connect OUT pin of TPS26611 to the other channel of ADC for current measurement. EN pin of TPS26611 can be used to switch between current and voltage measurements. With EN = 0, the internal FETs of TPS26611 are turned off and voltage signal can be measured by ADC between AIN0 and AINCOM pins. Whereas with EN = 1, the internal FETs of TPS26611 are turned on and current signal can be measured by ADC between AINx and AINCOM pins.

#### 9.3.1 Design Requirements

**Table 9-3. Design Parameters**

PARAMETER	VALUE
Input Current ( $I_{IN}$ )	±20 mA
Input Voltage ( $V_{IN}$ )	± 10 V
Current Limit for ( $I_{IN}$ )	±32 mA
$R_{Burden}$	50 to 250 $\Omega$

### 9.3.2 Detailed Design Procedure for Analog Input Protection for Multiplexed Current and Voltage Inputs with TPS26611

#### 9.3.2.1 Selecting $\pm V_s$ Supplies for TPS26611

See  $V_s$  supply selection in [Typical Application: Analog Input Protection for Current Inputs with TPS26610](#).

#### 9.3.2.2 Selecting MODE Configuration for TPS26611

For minimum power dissipation in burden resistor, use MODE = GND. See [Device Functional Modes](#) for selecting the mode configuration.

#### 9.3.2.3 Selecting Bias Resistors R1, R2 for Setting Common Mode Voltage for Voltage Inputs

For setting the common mode voltage with floating burden resistor (SW1 = Open), bias resistor R1 and R2 are required.

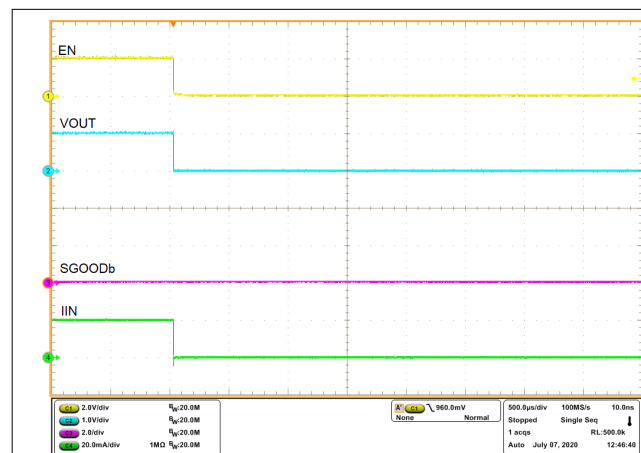

Resistors R1, R2 provide low impedance path for off state (EN = 0) leakage currents from IN and OUT pins of TPS26611. R1, R2 are selected to keep bias current less than 4  $\mu\text{A}$  through these resistors for current measurements with  $R_{\text{burden}}$  (EN = 1).

**Table 9-4. Selection of Bias Resistors R1, R2**

Analog Input Voltage for ADC	$\pm V_s$ Supplies	Bias Current Through R1, R2	R1	R2
$\pm 10\text{ V}$	$\pm 15\text{ V}$	$< 4\ \mu\text{A}$	1.39 to 1.66 M $\Omega$	6.67 to 6.94 M $\Omega$
$\pm 12.5\text{ V}$	$\pm 15\text{ V}$	$< 4\ \mu\text{A}$	1.35 to 1.71 M $\Omega$	6.62 to 6.98 M $\Omega$
$\pm 15\text{ V}$	$\pm 18\text{ V}$	$< 4\ \mu\text{A}$	1.29 to 1.75 M $\Omega$	6.58 to 7.04 M $\Omega$

### 9.3.3 Application Performance Plots for V/I Inputs with TPS26611

In addition to current limiting, reduced power dissipation in burden resistor, reverse current blocking and surge protection illustrated in [Application Performance Plots for Current Inputs with TPS26610](#), TPS26611 provides enable control for selecting between voltage and current inputs.

**Figure 9-9. Enable Control with TPS26611 (EN = Low)**

**Figure 9-10. Enable Control with TPS26611 (EN = High)**

## 9.4 System Examples

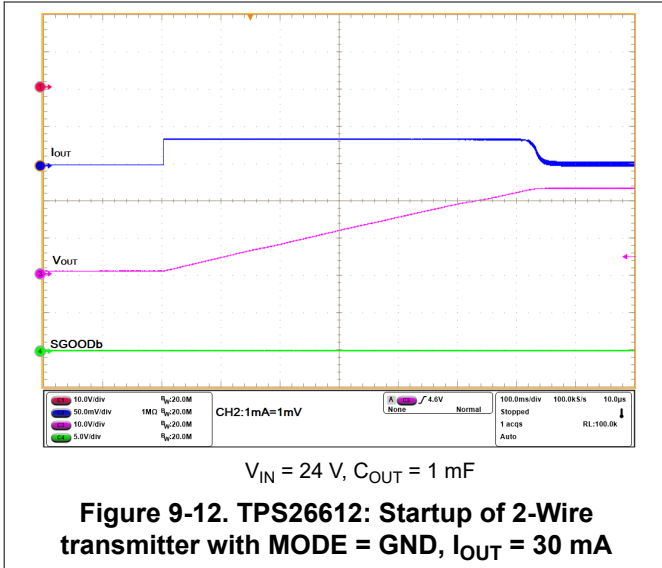

### 9.4.1 Power Supply Protection of 2-Wire Transmitter with TPS26612

**Figure 9-11. Power Supply Protection for 2-Wire Transmitter with TPS26612**

TPS26612 can be used for protection of power supply powering a two wire field transmitter as shown in [Figure 9-11](#). Connect an external signal diode (D1) from IN to +Vs pin of TPS26612 in case of external field supply to protect the system from miswiring. In case the supply is internal to the module and miswiring is not a possibility, the signal diode (D1) is not needed. TPS26612 device includes higher threshold for overvoltage protection on OUT to accommodate the voltage drop of diode (D1) between IN and +Vs.

TPS26612 has over-load expiry time ( $t_{OL\_expiry}$ ) disabled for the first overload fault after power-up up to a duration of  $t_{AR\_dis}$  (5 sec). With overload expiry time disabled, TPS26612 is able to power up 2-wire transmitters requiring higher start-up for longer durations (up to 5 sec.). The current limit threshold ( $I_{OL}$  or  $2 \times I_{OL}$ ) for startup can be selected by MODE pin.

During the first overload fault, if the junction temperature reaches  $T_{SD}$ , the device turns off the internal FETs and turns on as the junction temperature goes below  $[T_{TSD} - T_{TSDHyst}]$ .

#### 9.4.2 Protection of 3-Wire Transmitters and Analog Output Modules With TPS26611, TPS26612

Diode (D1) is required for Signal line Surge (IEC61000-4-5) protection.

**Figure 9-14. Analog Output Protection with TPS26611 or TPS26612**

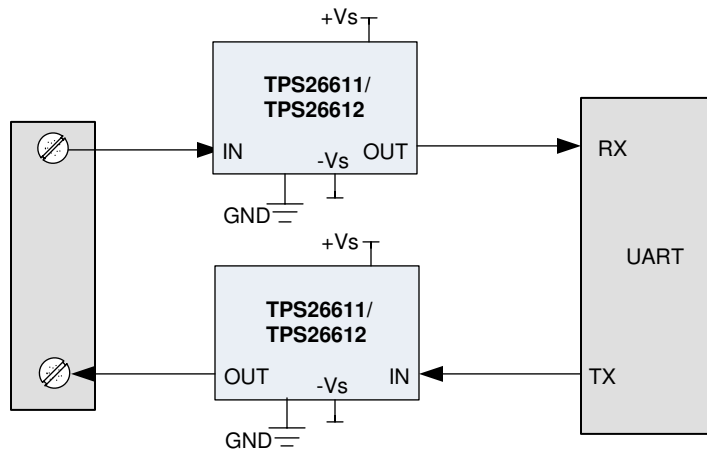

TPS26611 or TPS26612 can be used for protection of the analog output a 3/4-wire transmitter and analog output module against any high voltage field miswiring as shown in Figure 9-14. The OUT pin voltage is monitored with respect to the  $+V_s/-V_s$  supply voltages. If the OUT voltage goes outside the  $+V_s/-V_s$  supply rails, the FETs cutoff current conduction path and protects the whole system. The voltage at OUT pin of TPS2661x can be sensed by DAC amplifier to compensate for  $R_{ON}$  of TPS2661x

### 9.4.3 UART IO Protection With TPS26611, TPS26612

TPS26611 or TPS26612 can be used for protection of UART IO lines as shown in Figure 9-17. The OUT pin voltage is monitored with respect to the  $+V_S$ / $-V_S$  supply voltages. If the OUT voltage goes outside the  $+V_S$ / $-V_S$  supply rails, the FETs cutoff the current conduction path and protects the whole system.

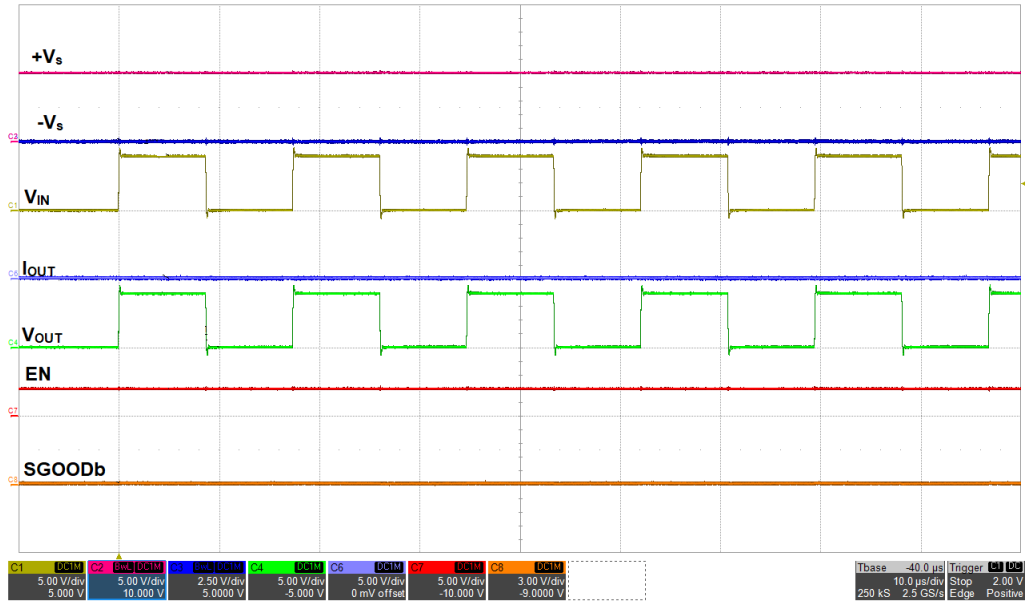

Figure 9-18. 115.2-Kbps UART Signal Through TPS2661x with  $V_s$  of 5 V

Figure 9-18 shows a UART signal of 115.2 Kbps through TPS2661x with amplitude of 4 V.

#### 9.4.4 Higher Loop Impedance With TPS26613 and TPS26614

TPS26613 and TPS26614 devices can support higher loop impedance by providing auto-retry feature when input voltage is less than  $-V_s$ . TPS26613 and TPS26614 devices do not have UVLO protection on input and provide auto-retry for transmitter output supporting higher loop impedance. Figure 9-19 provides the behavior of TPS26613 device with input voltage less than  $-V_s$ .

Figure 9-19. Auto-Retry in TPS26613 and TPS26614 for  $V_{in} < -V_s$

## 10 Power Supply Recommendations

**Table 10-1. Power Supplies for TPS2661x Devices**

Device	Dual Supply ( $\pm V_s$ )	Single Supply (+Vs, GND)
TPS26610, TPS26611, TPS26613, TPS26614	+Vs: 2.25 V to 30 V, -Vs: -20 V to 0 V	+Vs: 3 V to 30 V, -Vs: GND
TPS26612	+Vs: 2.25 V to 30 V, -Vs: -20 V to 0 V	+Vs: 4 V to 30 V, -Vs: GND

For operation with dual supplies, TPS2661x devices need a minimum difference of 3 V between +Vs and -Vs. For reverse current blocking with single supply, see [Reverse Current Blocking for Unipolar Current Inputs \(4–20 mA, 0–20 mA\)](#).

## 11 Layout

### 11.1 Layout Guidelines

- Keep the loop current power-path as short as possible.
- Place  $R_{MODE}$  resistor close to MODE and GND pins of the device.
- For protection from IEC61000-4-5 surge transients (signal lines) on input, place the TVS close to IN pin of the device.
- Place at least 100-nF ceramic capacitors close to the device if power supplies for  $\pm V_s$  are far from the device.
- Connect GND pin of the device to GND of  $\pm V_s$  supplies.
- Route both terminals of  $R_{burden}$  differentially to ADC inputs (AINP, AINM).
- Keep EN and  $\overline{SGOOD}$  signal lines away from loop current to avoid digital noise.

### 11.2 Layout Example

Figure 11-1. Layout Example

## 12 Device and Documentation Support

### 12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 12.2 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 12.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

### 12.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 12.5 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TPS26610DDFR	ACTIVE	SOT-23-THIN	DDF	8	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 125	2HSF	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
