## Mode of Operation

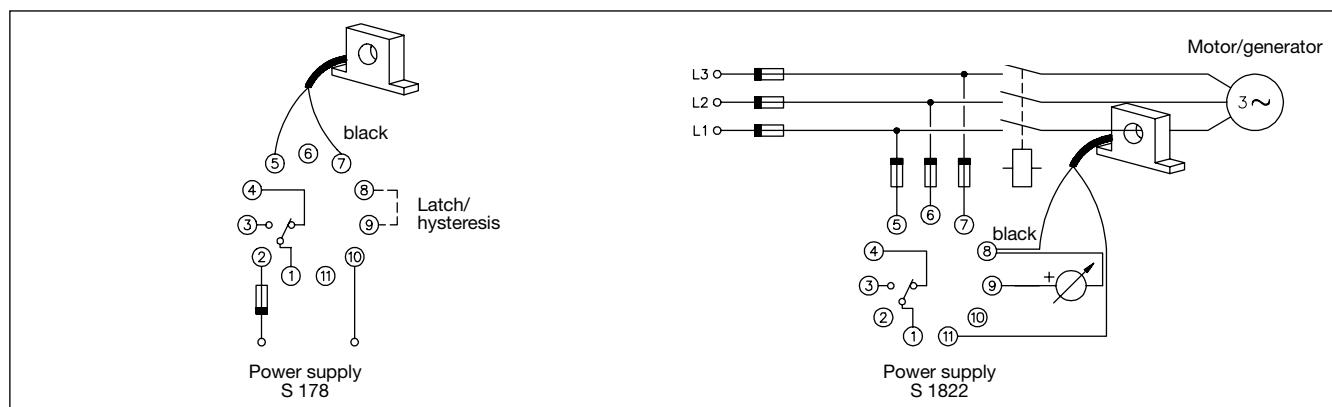

The metered conductor is drawn through the central hole of the current metering transformer. Drawing the conductor through the hole several times makes it possible to meter currents below the nominal range.

In amplitude and phase the output voltage is proportional to the phase current metered.

4 V<sub>p</sub> will then be equal to the rms-value of the nominal phase current.

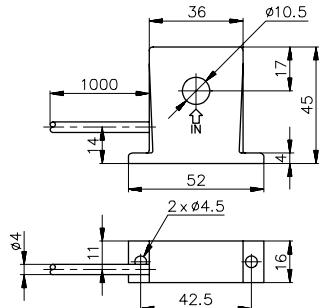

If the conductor is drawn through the central hole e.g. 5 times, the metering trans-
