

Low-Voltage, 1 Ω SPDT Analog Switch with Power-Off Isolation

FSA4159

Description

The FSA4159 is a high-performance Single-Pole / Double-Throw (SPDT) analog switch. The device features ultra-low R_{ON} of 1 Ω at 4.5 V V_{CC} and operates over the wide V_{CC} range of 1.65 V to 5.50 V. The device is fabricated with sub-micron CMOS technology to achieve fast switching speeds and is designed for break-before-make operation.

The FSA4159 features very low quiescent current even when the control voltage is lower than the V_{CC} supply. This feature services mobile handset applications by allowing direct interface with baseband processor general-purpose I/Os.

Features

- Low I_{CC} when the S Input is Lower than V_{CC}

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

3. On resistance is determined by the voltage drop between A and B pins at the indicated current through the switch.

4. ΔR_{ON} = R_{ON max} - R_{ON min} measured at identical V_{CC}, temperature and voltage.

5. Flatness is defined as the difference between the maximum and minimum value of on resistance over the specified range of conditions.
