

FAMILY OF MICROPOWER RAIL-TO-RAIL INPUT AND OUTPUT OPERATIONAL AMPLIFIERS

FEATURES

- BiMOS Rail-to-Rail Input/Output
- Input Bias Current . . . 1 pA
- High Wide Bandwidth . . . 160 kHz
- High Slew Rate . . . 0.1 V/ μ s
- Supply Current . . . 7 μ A (per channel)
- Input Noise Voltage . . . 90 nV/ $\sqrt{\text{Hz}}$
- Supply Voltage Range . . . 2.7 V to 16 V
- Specified Temperature Range
 - –40°C to 125°C . . . Industrial Grade
- Ultra-Small Packaging
 - 5 Pin SOT-23 (TLV2381)
 - 8 Pin MSOP (TLV2382)

APPLICATIONS

- Portable Medical
- Power Monitoring
- Low Power Security Detection Systems
- Smoke Detectors

DESCRIPTION

The TLV238x single supply operational amplifiers provide rail-to-rail input and output capability. The TLV238x takes the minimum operating supply voltage down to 2.7 V over the extended industrial temperature range, while adding the rail-to-rail output swing feature. The TLV238x also provides 160-kHz bandwidth from only 7 μ A. The maximum recommended supply voltage is 16 V, which allows the devices to be operated from (\pm 8 V supplies down to \pm 1.35 V) two rechargeable cells.

The combination of rail-to-rail inputs and outputs make them good upgrades for the TLC27Lx family—offering more bandwidth at a lower quiescent current. The offset voltage is lower than the TLC27LxA variant.

To maintain cost effectiveness the TLV2381/2 are only available in the extended industrial temperature range. This means that one device can be used in a wide range of applications that include PDAs as well as automotive sensor interface.

All members are available in SOIC, with the singles in the small SOT-23 package, duals in the MSOP.

SELECTION GUIDE

DEVICE	V _S [V]	I _{Q/ch} [μ A]	V _{ICR} [V]	V _{IO} [mV]	I _{IB} [pA]	GBW [MHz]	SLEW RATE [V/ μ s]	V _n , 1 kHz [nV/ $\sqrt{\text{Hz}}$]

† Product preview

absolute maximum ratings over operating free-air temperature (unless otherwise noted)†

Supply voltage, V_S	16.5 V
Input voltage, V_I (see Notes 1 and 2)	$V_S + 0.2$ V
Output current, I_O	100 mA
Differential input voltage, V_{ID}	V_S
Continuous total power dissipation	See Dissipation Rating Table
Maximum junction temperature, T_J	150°C
Operating free-air temperature range, T_A : I suffix	-40°C to 125°C
Storage temperature range, T_{STG}	-65°C to 125°C
Lead temperature 1.6 mm (1/16 inch) from case for 10 seconds	300°C

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. Relative to GND pin.

2. Maximum is 16.5 V or $V_S + 0.2$ V whichever is the lesser value.

DISSIPATION RATING TABLE

PACKAGE	θ_{JC} (°C/W)	θ_{JA} (°C/W)	$T_A \leq 25^\circ\text{C}$ POWER RATING	$T_A = 85^\circ\text{C}$ POWER RATING
D (8)	38.3	176	710 mW	370 mW
DBV (5)	55	324.1	385 mW	201 mW
DBV (6)	55	294.3	425 mW	221 mW
DGK (8)	4.7	58.4	2.14 W	1.11 W

‡ This data was taken using the JEDEC standard Low-K test PCB. For the JEDEC Proposed High-K test PCB, θ_{JA} is 95°C/W with power rating at $T_A = 25^\circ\text{C}$ of 1.32 W.

§ This data was taken using 2 oz. trace and copper pad that is soldered directly to a 3 in. x 3 in. PCB. For further information, refer to Application Information section of this data sheet.

APPLICATION INFORMATION**offset voltage**

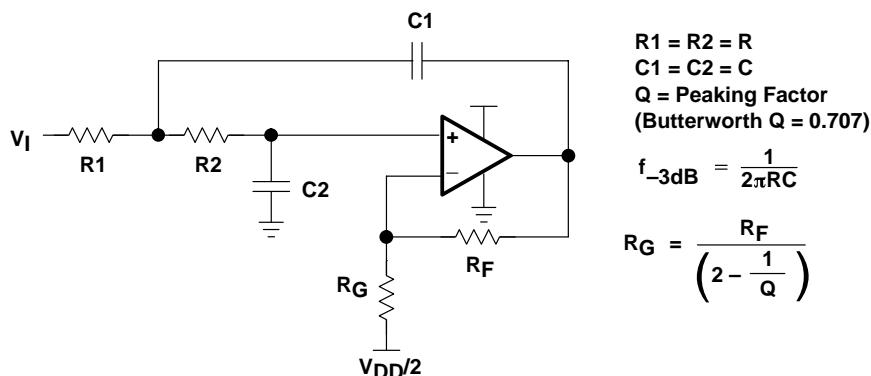

The output offset voltage (V_{OO}) is the sum of the input offset voltage (V_{IO}) and both input bias currents (I_{IB}) times the corresponding gains. The following schematic and formula can be used to calculate the output offset voltage:

**Figure 25. Output Offset Voltage Model****general configurations**

When receiving low-level signals, limiting the bandwidth of the incoming signals into the system is often required. The simplest way to accomplish this is to place an RC filter at the noninverting terminal of the amplifier (see Figure 26).

**Figure 26. Single-Pole Low-Pass Filter**

If even more attenuation is needed, a multiple pole filter is required. The Sallen-Key filter can be used for this task. For best results, the amplifier should have a bandwidth that is 8 to 10 times the filter frequency bandwidth. Failure to do this can result in phase shift of the amplifier.

**Figure 27. 2-Pole Low-Pass Sallen-Key Filter**

APPLICATION INFORMATION

circuit layout considerations

To achieve the levels of high performance of the TLV238x, follow proper printed-circuit board design techniques. A general set of guidelines is given in the following.

- **Ground planes**—It is highly recommended that a ground plane be used on the board to provide all components with a low inductive ground connection. However, in the areas of the amplifier inputs and output, the ground plane can be removed to minimize the stray capacitance.
- **Proper power supply decoupling**—Use a 6.8- μ F tantalum capacitor in parallel with a 0.1- μ F ceramic capacitor on each supply terminal. It may be possible to share the tantalum among several amplifiers depending on the application, but a 0.1- μ F ceramic capacitor should always be used on the supply terminal of every amplifier. In addition, the 0.1- μ F capacitor should be placed as close as possible to the supply terminal. As this distance increases, the inductance in the connecting trace makes the capacitor less effective. The designer should strive for distances of less than 0.1 inches between the device power terminals and the ceramic capacitors.
- **Sockets**—Sockets can be used but are not recommended. The additional lead inductance in the socket pins will often lead to stability problems. Surface-mount packages soldered directly to the printed-circuit board is the best implementation.
- **Short trace runs/compact part placements**—Optimum high performance is achieved when stray series inductance has been minimized. To realize this, the circuit layout should be made as compact as possible, thereby minimizing the length of all trace runs. Particular attention should be paid to the inverting input of the amplifier. Its length should be kept as short as possible. This will help to minimize stray capacitance at the input of the amplifier.
- **Surface-mount passive components**—Using surface-mount passive components is recommended for high performance amplifier circuits for several reasons. First, because of the extremely low lead inductance of surface-mount components, the problem with stray series inductance is greatly reduced. Second, the small size of surface-mount components naturally leads to a more compact layout thereby minimizing both stray inductance and capacitance. If leaded components are used, it is recommended that the lead lengths be kept as short as possible.

APPLICATION INFORMATION**general power dissipation considerations**

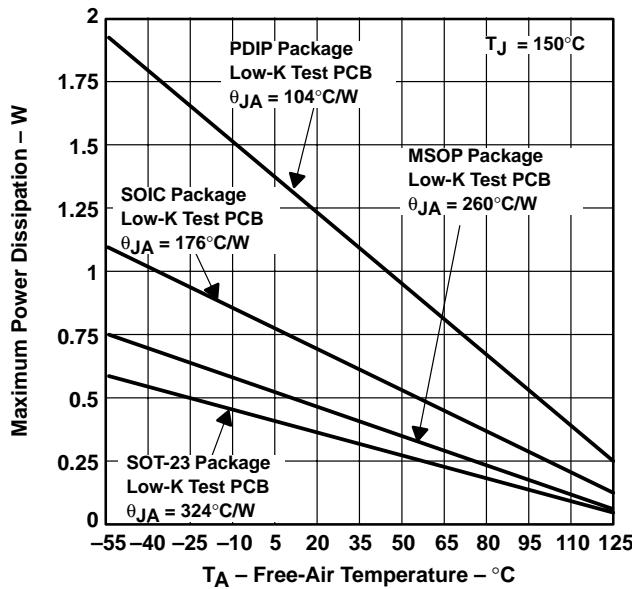

For a given θ_{JA} , the maximum power dissipation is shown in Figure 28 and is calculated by the following formula:

$$P_D = \left(\frac{T_{MAX} - T_A}{\theta_{JA}} \right)$$

Where:

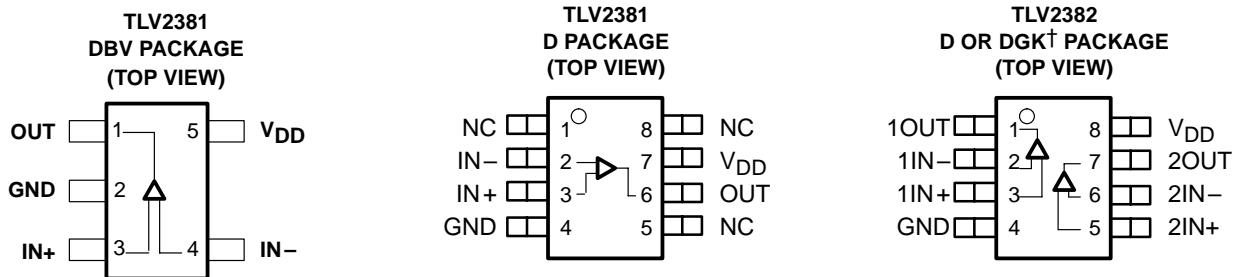

- P_D = Maximum power dissipation of TLV238x IC (watts)
- T_{MAX} = Absolute maximum junction temperature (150°C)
- T_A = Free-ambient air temperature ($^{\circ}\text{C}$)
- $\theta_{JA} = \theta_{JC} + \theta_{CA}$
- θ_{JC} = Thermal coefficient from junction to case
- θ_{CA} = Thermal coefficient from case to ambient air ($^{\circ}\text{C}/\text{W}$)

**MAXIMUM POWER DISSIPATION
vs
FREE-AIR TEMPERATURE**

NOTE A: Results are with no air flow and using JEDEC Standard Low-K test PCB.

Figure 28. Maximum Power Dissipation vs Free-Air Temperature
