

**Document Title**

**256Kx36 & 512Kx18-Bit Synchronous Pipelined Burst SRAM**

**Revision History**

<u>Rev. No.</u>	<u>History</u>	<u>Draft Date</u>	<u>Remark</u>
0.0	Initial draft	April. 10 . 1998	Preliminary
0.1	Modify DC characteristics( Input Leakage Current test Conditions) form $V_{DD}=V_{SS}$ to $V_{DD}$ to Max.	June .08. 1998	Preliminary
0.2	Change DC Characteristics. ISB value from 80mA to 130mA at -60 ISB value from 70mA to 120mA at -67 ISB value from 65mA to 110mA at -72 ISB value from 50mA to 100mA at -10 ISB1 value from 10mA to 30mA ISB2 value from 10mA to 30mA	Aug . 27. 1998	Preliminary
0.3	1. Remove speed bin -60. 2. Changed DC condition at Icc and parameters Icc ; from 400mA to 420mA at -67, from 375mA to 400mA at -72, from 300mA to 350mA at -10, ISB ; from 120mA to 150mA at -67, from 110mA to 130mA at -72, from 100mA to 120mA at -10,	Sep. 09. 1998	Preliminary
0.4	1. Add x32 organization.	Oct. 15. 1998	Preliminary
0.5	1. Add $V_{DDQ}$ Supply voltage( 2.5V I/O )	Dec. 10. 1998	Preliminary
0.6	1. Changed $V_{OL}$ Max value from 0.2V to 0.4V at 2.5V I/O.	Dec. 23. 1998	Preliminary
1.0	1. Final spec Release. 2. Remove x32 organization.	Jan. 29. 1999	Final
2.0	1. Remove $V_{DDQ}$ Supply voltage( 2.5V I/O )	Feb. 25. 1999	Final
3.0	1. Add $V_{DDQ}$ Supply voltage( 2.5V I/O )	May. 13. 1999	Final
4.0	1. Change tOE from 4.0ns to 3.8ns at -72 .	July. 05. 1999	Final
5.0	1. Add tCYC 167MHz and 200MHz. 2. Changed DC condition at Icc and parameters Icc ; from 420mA to 400mA at -67, from 400mA to 350mA at -72, from 350mA to 300mA at -10,	Nov. 19. 1999	Final

The attached data sheets are prepared and approved by SAMSUNG Electronics. SAMSUNG Electronics CO., LTD. reserve the right to change the specifications. SAMSUNG Electronics will evaluate and reply to your requests and questions on the parameters of this device. If you have any questions, please contact the SAMSUNG branch office near your office, call or contact Headquarters.

**256Kx36 & 512Kx18-bit Synchronous Pipelined Burst SRAM**

**FEATURES**

- Synchronous Operation.
- 2 Stage Pipelined operation with 4 Burst.
- On-Chip Address Counter.
- Self-Timed Write Cycle.
- On-Chip Address and Control Registers.
- 3.3V+0.165V/-0.165V Power Supply.
- I/O Supply Voltage 3.3V+0.165V/-0.165V for 3.3V I/O or 2.5V+0.4V/-0.125V for 2.5V I/O
- 5V Tolerant Inputs Except I/O Pins.
- Byte Writable Function.
- Global Write Enable Controls a full bus-width write.
- Power Down State via ZZ Signal.
- LBO Pin allows a choice of either a interleaved burst or a linear burst.
- Three Chip Enables for simple depth expansion with No Data Contention only for TQFP ; 2cycle Enable, 1cycle Disable.
- Asynchronous Output Enable Control.
- ADSP, ADSC, ADV Burst Control Pins.
- TTL-Level Three-State Output.
- 100-TQFP-1420A / 119BGA(7x17 Ball Grid Array Package)

**FAST ACCESS TIMES**

PARAMETER	Symbol	-50	-60	-67	-72	-10	Unit
Cycle Time	tcyc	5.0	6.0	6.7	7.2	10	ns
Clock Access Time	tcd	3.1	3.5	3.8	4.0	4.5	ns
Output Enable Access Time	toE	3.1	3.5	3.8	3.8	4.5	ns

**GENERAL DESCRIPTION**

The KM736V889 and KM718V989 are 9,437,184-bit Synchronous Static Random Access Memory designed for high performance second level cache of Pentium and Power PC based System.

It is organized as 256K(512K) words of 36(18) bits and integrates address and control registers, a 2-bit burst address counter and added some new functions for high performance cache RAM applications;  $\overline{GW}$ ,  $\overline{BW}$ ,  $\overline{LBO}$ ,  $\overline{ZZ}$ . Write cycles are internally self-timed and synchronous.

Full bus-width write is done by  $\overline{WEx}$  and each byte write is performed by the combination of  $\overline{WEx}$  and  $\overline{BW}$  when  $\overline{GW}$  is high. And with  $\overline{CS1}$  high,  $\overline{ADSP}$  is blocked to control signals. Burst cycle can be initiated with either the address status processor( $\overline{ADSP}$ ) or address status cache controller( $\overline{ADSC}$ ) inputs. Subsequent burst addresses are generated internally in the system's burst sequence and are controlled by the burst address advance( $\overline{ADV}$ ) input.

$\overline{LBO}$  pin is DC operated and determines burst sequence(linear or interleaved).

$\overline{ZZ}$  pin controls Power Down State and reduces Stand-by current regardless of CLK.

The KM736V889 and KM718V989 are fabricated using SAMSUNG's high performance CMOS technology and is available in a 100pin TQFP and 119BGA package. Multiple power and ground pins are utilized to minimize ground bounce.

**FUNCTION DESCRIPTION**

The KM736V889 and KM718V989 are synchronous SRAM designed to support the burst address accessing sequence of the Power PC based microprocessor. All inputs (with the exception of  $\overline{OE}$ , LBO and ZZ) are sampled on rising clock edges. The start and duration of the burst access is controlled by  $\overline{ADSC}$ ,  $\overline{ADSP}$  and  $\overline{ADV}$  and chip select pins.

The accesses are enabled with the chip select signals and output enabled signals. Wait states are inserted into the access with  $\overline{ADV}$ .

When ZZ is pulled high, the SRAM will enter a Power Down State. At this time, internal state of the SRAM is preserved. When ZZ returns to low, the SRAM normally operates after 2cycles of wake up time. ZZ pin is pulled down internally.

Read cycles are initiated with  $\overline{ADSP}$ (regardless of  $\overline{WEx}$  and  $\overline{ADSC}$ )using the new external address clocked into the on-chip address register whenever  $\overline{ADSP}$  is sampled low, the chip selects are sampled active, and the output buffer is enabled with  $\overline{OE}$ . In read operation the data of cell array accessed by the current address, registered in the Data-out registers by the positive edge of CLK, are carried to the Data-out buffer by the next positive edge of CLK. The data, registered in the Data-out buffer, are projected to the output pins.  $\overline{ADV}$  is ignored on the clock edge that samples  $\overline{ADSP}$  asserted, but is sampled on the subsequent clock edges. The address increases internally for the next access of the burst when  $\overline{WEx}$  are sampled High and  $\overline{ADV}$  is sampled low. And  $\overline{ADSP}$  is blocked to control signals by disabling  $\overline{CS1}$ .

All byte write is done by  $\overline{GW}$ (regardless of  $\overline{BW}$  and  $\overline{WEx}$ ), and each byte write is performed by the combination of  $\overline{BW}$  and  $\overline{WEx}$  when  $\overline{GW}$  is high.

Write cycles are performed by disabling the output buffers with  $\overline{OE}$  and asserting  $\overline{WEx}$ .  $\overline{WEx}$  are ignored on the clock edge that samples  $\overline{ADSP}$  low, but are sampled on the subsequent clock edges. The output buffers are disabled when  $\overline{WEx}$  are sampled Low(regardless of  $\overline{OE}$ ). Data is clocked into the data input register when  $\overline{WEx}$  sampled Low. The address increases internally to the next address of burst, if both  $\overline{WEx}$  and  $\overline{ADV}$  are sampled Low. Individual byte write cycles are performed by any one or more byte write enable signals( $\overline{WEa}$ ,  $\overline{WEb}$ ,  $\overline{WEc}$  or  $\overline{WEd}$ ) sampled low. The  $\overline{WEa}$  control DQa0 ~ DQa7 and DQPa,  $\overline{WEb}$  controls DQb0 ~ DQb7 and DQPb,  $\overline{WEc}$  controls DQc0 ~ DQc7 and DQPc, and  $\overline{WEd}$  control DQd0 ~ DQd7 and DQPd. Read or write cycle may also be initiated with  $\overline{ADSC}$ , instead of  $\overline{ADSP}$ . The differences between cycles initiated with  $\overline{ADSC}$  and  $\overline{ADSP}$  as are follows;

$\overline{ADSP}$  must be sampled high when  $\overline{ADSC}$  is sampled low to initiate a cycle with  $\overline{ADSC}$ .

$\overline{WEx}$  are sampled on the same clock edge that sampled  $\overline{ADSC}$  low(and  $\overline{ADSP}$  high).

Addresses are generated for the burst access as shown below, The starting point of the burst sequence is provided by the external address. The burst address counter wraps around to its initial state upon completion. The burst sequence is determined by the state of the LBO pin. When this pin is Low, linear burst sequence is selected. When this pin is High, Interleaved burst sequence is selected.

**BURST SEQUENCE TABLE**

(Interleaved Burst)

$\overline{LBO}$ PIN	HIGH	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	0	0	1	1	1	0
	Fourth Address	1	0	1	1	0	0	0	1
		1	1	1	0	0	1	0	0

(Linear Burst)

$\overline{LBO}$ PIN	LOW	Case 1		Case 2		Case 3		Case 4	
		A1	A0	A1	A0	A1	A0	A1	A0
	First Address	0	0	0	1	1	0	1	1
	↓	0	1	1	0	1	1	0	0
	Fourth Address	1	0	1	1	0	0	0	1
		1	1	0	0	0	1	1	0

Note : 1. LBO pin must be tied to High or Low, and Floating State must not be allowed.

**ASYNCHRONOUS TRUTH TABLE**

OPERATION	ZZ	$\overline{OE}$	I/O STATUS
Sleep Mode	H	X	High-Z
Read	L	L	DQ
	L	H	High-Z
Write	L	X	Din, High-Z
Deselected	L	X	High-Z

**Notes**

1. X means "Don't Care".
2. ZZ pin is pulled down internally
3. For write cycles that following read cycles, the output buffers must be disabled with  $\overline{OE}$ , otherwise data bus contention will occur.
4. Sleep Mode means power down state of which stand-by current does not depend on cycle time.
5. Deselected means power down state of which stand-by current depends on cycle time.

**TRUTH TABLES**

**SYNCHRONOUS TRUTH TABLE**

$\overline{CS}_1$	$\overline{CS}_2$	$\overline{CS}_2$	$\overline{ADSP}$	$\overline{ADSC}$	$\overline{ADV}$	$\overline{WRITE}$	CLK	ADDRESS ACCESSED	OPERATION

Voltage on I/O Pin Relative to Vss	VIO	-0.3 to VDDQ+0.5	V
Power Dissipation	PD	1.6	W
Storage Temperature	TSTG	-65 to 150	°C
Operating Temperature	TOPR	0 to 70	°C
Storage Temperature Range Under Bias	TBIAS	-10 to 85	°C

**\*Note** : Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**OPERATING CONDITIONS at 3.3V I/O (0°C ≤ TA ≤ 70°C)**

PARAMETER	SYMBOL	MIN	Typ.	MAX	UNIT
Supply Voltage	VDD	3.135	3.3	3.465	V
	VDDQ	3.135	3.3	3.465	V
Ground	VSS	0	0	0	V

**OPERATING CONDITIONS at 2.5V I/O (0°C ≤ TA ≤ 70°C)**

PARAMETER	SYMBOL	MIN	Typ.	MAX	UNIT
Supply Voltage	VDD	3.135	3.3	3.465	V
	VDDQ	2.375	2.5	2.9	V
Ground	VSS	0	0	0	V

**CAPACITANCE\* (TA=25°C, f=1MHz)**

PARAMETER	SYMBOL	TEST CONDITION	MIN	MAX	UNIT
Input Capacitance	CIN	VIN=0V	-	6	pF
Output Capacitance	COU	VOUT=0V	-	8	pF

**\*Note** : Sampled not 100% tested.

**DC ELECTRICAL CHARACTERISTICS**( $V_{DD}=3.3V+0.165V/-0.165V$ ,  $T_A=0^{\circ}C$  to  $+70^{\circ}C$ )

**Notes :** 1. All address inputs must meet the specified setup and hold times for all rising clock edges whenever ADSC and/or ADSP is sampled low and CS is sampled low. All other synchronous inputs must meet the specified setup and hold times whenever this device is chip selected.  
2. Both chip selects must be active whenever ADSC or ADSP is sampled low in order for the this device to remain enabled.  
3. ADSC or ADSP must not be asserted for at least 2 Clock after leaving ZZ state.
