

AD7524
Advanced LinCMOS™ 8-BIT MULTIPLYING
DIGITAL-TO-ANALOG CONVERTER
D3100, APRIL 1988

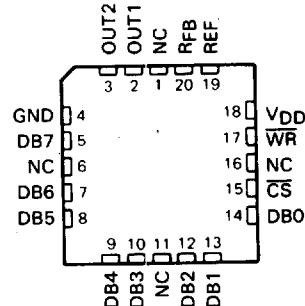

- Advanced LinCMOS™ Silicon-Gate Technology
- Easily Interfaced to Microprocessors
- On-Chip Data Latches
- Monotonicity Over Entire A/D Conversion Range
- Segmented High-Order Bits Ensure Low-Glitch Output
- Designed to be Interchangeable with Analog Devices AD7524, PMI PM-7524, and Micro Power Systems MP7524
- Fast Control Signaling for Digital Signal Processor Applications Including Interface with TMS320

KEY PERFORMANCE SPECIFICATIONS	
Resolution	8 Bits
Linearity error	½ LSB Max
Power dissipation at $V_{DD} = 5$ V	5 mW Max
Settling time	100 ns Max
Propagation delay	80 ns Max

NC — No internal connection

description

The AD7524 is an Advanced LinCMOS™ 8-bit digital-to-analog converter (DAC) designed for easy interface to most popular microprocessors.

The AD7524 is an 8-bit multiplying DAC with input latches and with a load cycle similar to the "write" cycle of a random access memory. Segmenting the high-order bits minimizes glitches during changes in the most-significant bits, which produce the highest glitch impulse. The AD7524 provides accuracy to ½ LSB without the need for thin-film resistors or laser trimming, while dissipating less than 5 mW typically.

Featuring operation from a 5-V to 15-V single supply, the AD7524 interfaces easily to most microprocessor buses or output ports. Excellent multiplying (2 or 4 quadrant) makes the AD7524 an ideal choice for many microprocessor-controlled gain-setting and signal-control applications.

The AD7524A is characterized for operation from -25°C to 85°C, and the AD7524J is characterized for operation from 0°C to 70°C.

AVAILABLE OPTIONS

DEVICE	SYMBOLIZATION		OPERATING TEMPERATURE RANGE
	PACKAGE	SUFFIXES	
AD7524A	N		-25°C to 85°C
AD7524J	N	FN	0°C to 70°C

functional block diagram

operating sequence

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)

Supply voltage, V_{DD}	-0.3 V to 17 V
Voltage between R_{FB} and GND	± 25 V
Digital input voltage, V_I	-0.3 V to $V_{DD} + 0.3$ V
Reference voltage, V_{ref}	± 25 V
Peak digital input current, I_I	10 μ A
Operating free-air temperature range: AD7524A	-25°C to 85°C
AD7524J	0°C to 70°C
Storage temperature range	-65°C to 150°C
Case temperature for 10 seconds: FN package	260°C
Lead temperature 1.6 mm (1/16 inch) from case for 10 seconds: N package	260°C

operating characteristics over recommended operating free-air temperature range, $V_{ref} = 10\text{ V}$, OUT1 and OUT2 at GND (unless otherwise noted)

PARAMETER	TEST CONDITIONS	$V_{CC} = 5\text{ V}$		$V_{DD} = 15\text{ V}$		UNIT
		MIN	MAX	MIN	MAX	
Linearity error		±0.2		±0.2		%FSR
Gain error	See Note 1	Full range	±1.4	±0.6		%FSR
		25°C	±1	±0.5		
Settling time (to 1/2 LSB)	See Note 2		100	100	ns	
Propagation delay from digital input to 90% of final analog output current	See Note 2		80	80	ns	
Feedthrough at OUT1 or OUT2	$V_{ref} = \pm 10\text{ V}$ (100 kHz sinewave), WR and CS at 0, DBO-DB7 at 0	Full range	0.5	0.5		%FSR
		25°C	0.25	0.25		
Temperature coefficient of gain	$T_A = 25^\circ\text{C}$ to t_{min} or t_{max}		±0.004	±0.001	%FSR/°C	

NOTES: 1. Gain error is measured using the internal feedback resistor. Nominal Full Scale Range (FSR) = $V_{ref} - 1$ LSB.
 2. OUT1 load = 100 Ω, $C_{ext} = 13\text{ pF}$, WR at 0 V, CS at 0 V, DBO-DB7 at 0 V to V_{DD} or V_{DD} to 0 V.

PRINCIPLES OF OPERATION

The AD7524 is an 8-bit multiplying D/A converter consisting of an inverted R-2R ladder, analog switches, and data input latches. Binary weighted currents are switched between the OUT1 and OUT2 bus lines, thus maintaining a constant current in each ladder leg independent of the switch state. The high-order bits are decoded and these decoded bits, through a modification in the R-2R ladder, control three equally weighted current sources. Most applications only require the addition of an external operational amplifier and a voltage reference.

The equivalent circuit for all digital inputs low is seen in Figure 1. With all digital inputs low, the entire reference current, I_{ref} , is switched to OUT2. The current source $I/256$ represents the constant current flowing through the termination resistor of the R-2R ladder, while the current source I_{kg} represents leakage currents to the substrate. The capacitances appearing at OUT1 and OUT2 are dependent upon the digital input code. With all digital inputs high, the off-state switch capacitance (30 pF maximum) appears at OUT2 and the on-state switch capacitance (120 pF maximum) appears at OUT1. With all digital inputs low, the situation is reversed as shown in Figure 1. Analysis of the circuit for all digital inputs high is similar to Figure 1; however, in this case, I_{ref} would be switched to OUT1.

Interfacing the AD7524 D/A converter to a microprocessor is accomplished via the data bus and the CS and WR control signals. When CS and WR are both low, the AD7524 analog output responds to the data activity on the DBO-DB7 data bus inputs. In this mode, the input latches are transparent and input data directly affects the analog output. When either the CS signal or WR signal goes high, the data on the DBO-DB7 inputs are latched until the CS and WR signals go low again. When CS is high, the data inputs are disabled regardless of the state of the WR signal.

The AD7524 is capable of performing 2-quadrant or full 4-quadrant multiplication. Circuit configurations for 2-quadrant or 4-quadrant multiplication are shown in Figures 2 and 3. Input coding for unipolar and bipolar operation are summarized in Tables 1 and 2, respectively.
