**DESCRIPTION**

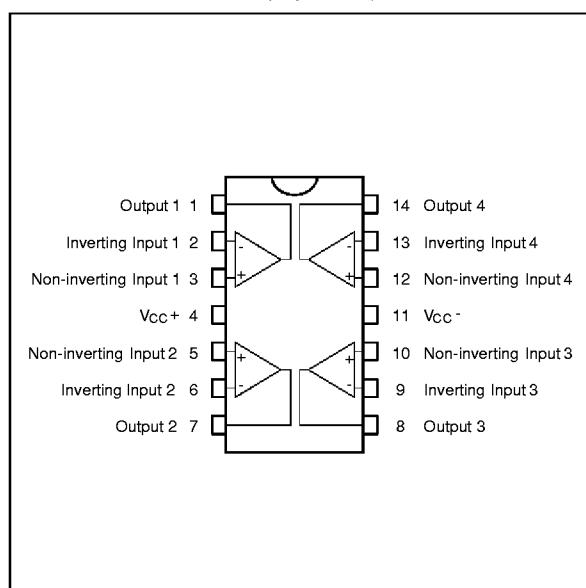

The TS274 series are low cost, low power quad operational amplifiers designed to operate with single or dual supplies. These operational amplifiers use the SGS-THOMSON silicon gate LIN MOS process giving them an excellent consumption-speed ratio. These series are ideally suited for low consumption applications.

Three power consumptions are available allowing to have always the best consumption-speed ratio :

- $I_{cc} = 10\mu A/\text{amp.}$  : TS27L4 (very low power)
- $I_{cc} = 150\mu A/\text{amp.}$  : TS27M4 (low power)
- $I_{cc} = 1mA/\text{amp.}$  : TS274 (high speed)

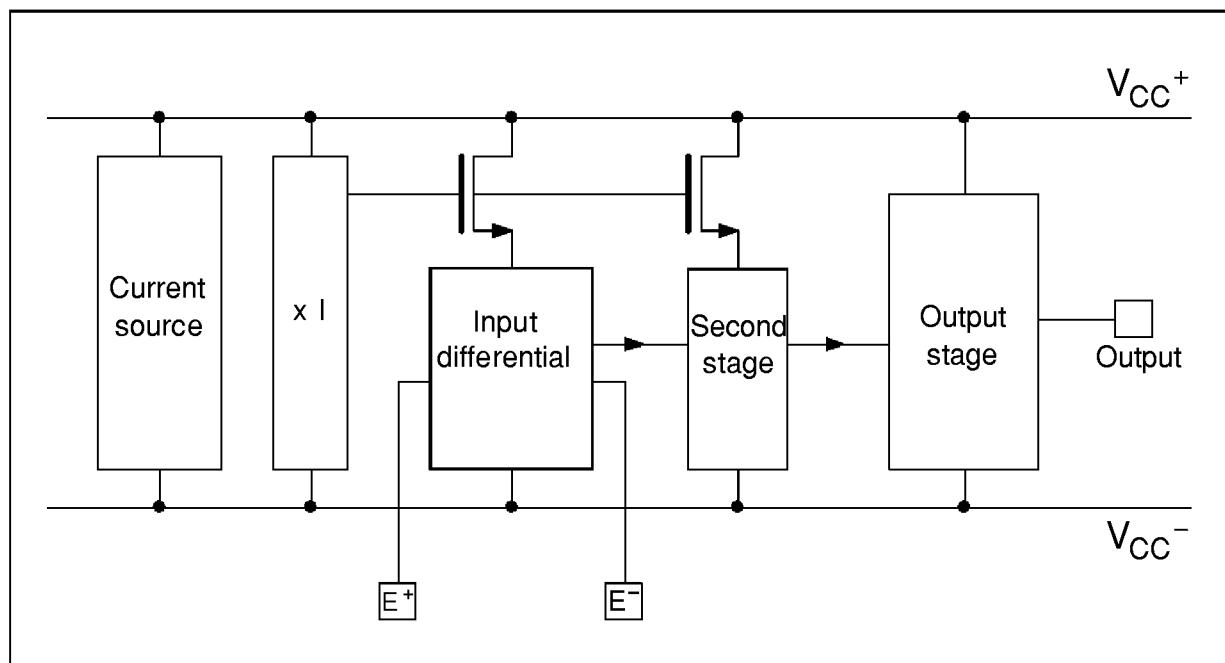

These CMOS amplifiers offer very high input impedance and extremely low input currents.

The major advantage versus JFET devices is the very low input currents drift with temperature (see figure 2).
