

High-Accuracy EPROM-Programmable PLL Die for Crystal Oscillators

Features

- Erasable programmable read only memory (EPROM) - programmable die for in-package programming of crystal oscillators
- High resolution Phase locked loop (PLL) with 12-bit multiplier and 10-bit divider
- EPROM programmable capacitor tuning array with optional shadow register
- Twice programmable die
- Simple two-wire programming interface
- On-chip oscillator runs from 10 MHz to 30 MHz fundamental tuned crystal
- EPROM-selectable Transistor transistor logic (TTL) or Complementary metal oxide semiconductor (CMOS) duty cycle levels
- Operating frequency:
 - 1 MHz to 133 MHz at 5 V
 - 1 MHz to 100 MHz at 3.3 V
 - 1 MHz to 66.6 MHz at 2.7 V
- Eight selectable post divide options, using PLL or reference oscillator output
- Programmable asynchronous or synchronous OE and power-down (PD#) modes(CY2037 and CY2037-2)
- Frequency select (CY2037-3)
- Low jitter outputs typically:
 - < ±100 ps (pk-pk) at 5 V and $f > 33$ MHz
 - < ±125 ps (pk-pk) at 3.3 V and $f > 33$ MHz
- 3.3 V or 5 V operation
- Small die
- Controlled rise and fall times and output slew rate

Table 1. Device Functionality: Output Frequencies

Parameter	Description	Condition	Min	Max	Unit
Fo	Output frequency	V _{DD} = 4.5 V to 5.5 V	1	133	MHz
		V _{DD} = 3.0 V to 3.6 V	1	100	MHz
		V _{DD} = 2.7 V to 3.0 V	1	66	MHz

Functional Description

CY2037 is an EPROM-programmable, high-accuracy, PLL-based die designed for the crystal oscillator market. The die attaches directly to a low cost 10 to 30 MHz crystal and can be packaged into a 4-pin through-hole or surface mount packages. The oscillator devices may be stocked as blank parts and custom frequencies programmed in-package at the last stage before shipping. This enables fast-turn manufacture of custom and standard crystal oscillators without the need for dedicated, expensive crystals.

CY2037 contains an on-chip oscillator and a unique oscillator tuning circuit for fine-tuning of the output frequency. The crystal C_{load} may be selectively adjusted by programming a set of seven EPROM bits. This feature is used to compensate for crystal variations or to obtain a more accurate synthesized frequency.

CY2037 uses EPROM programming with a simple two-wire, 4-pin interface that includes V_{SS} and V_{DD}. Clock outputs may be generated up to 133 MHz at 5 V or up to 100 MHz at 3.3 V. The entire configuration can be reprogrammed once, which allows the programmed inventory to be altered or reused.

CY2037 PLL die is designed for very high resolution. It has a 12-bit feedback counter multiplier and a 10-bit reference counter divider. This enables the synthesis of highly accurate and stable output clock frequencies with zero or low PPM error. The clock is further modified by eight output divider options of 1, 2, 4, 8, 16, 32, 64, and 128. The divider input can be selected as the PLL or crystal oscillator output, providing a total of 16 separate output options. For further flexibility, the output is selectable between TTL and CMOS duty cycle levels.

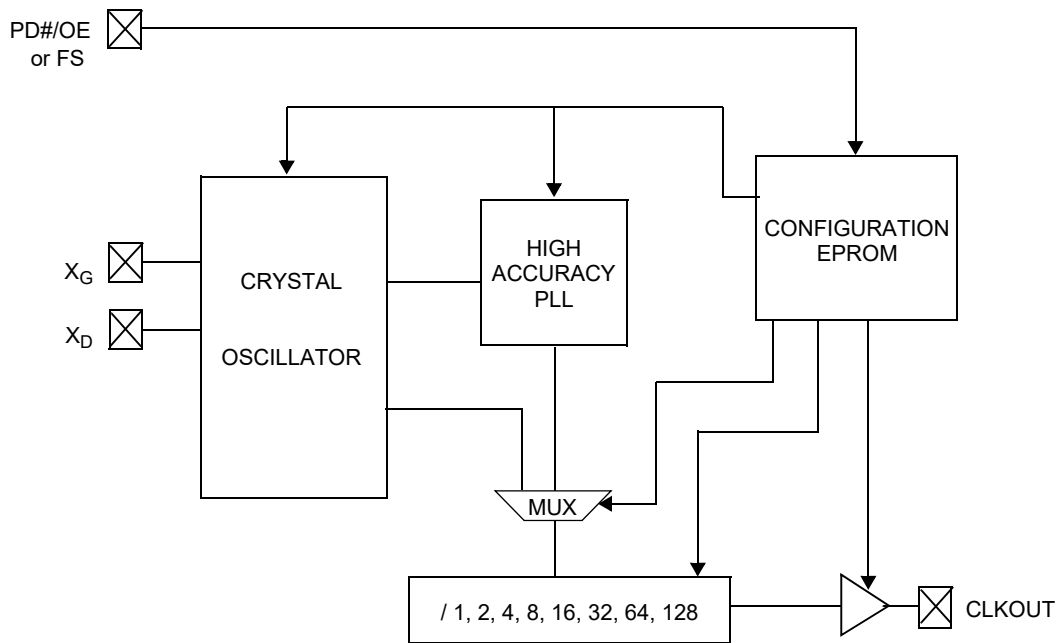

CY2037 also contain flexible power management controls. These parts include both power down (PD#) and output enable (OE) features with integrated pull-up resistors. The PD# and OE modes have an additional setting to determine timing (asynchronous or synchronous) with respect to the output signal. When PD# or OE modes are enabled, CLKOUT is tri-stated and pulled low by a weak pull-down. In PD# mode, all active circuitry on chip get shutdown, where in OE mode PLL and oscillator remain operating.

Controlled rise and fall times, unique output driver circuits, and innovative circuit layout techniques enable CY2037 to have low jitter and accurate outputs, making it suitable for most PC, networking, and consumer applications.

On the other hand, CY2037-3 contains a frequency select function in place of the power-down and output enable modes. For example, consumer products often require frequency compatibility with different electrical standards around the world. With this frequency select feature, a product that incorporates CY2037-3 could be compatible with both NTSC for North American, and PAL for Europe by simply changing the FS line. The twice programmable feature is absent in CY2037-3, because the second EPROM row is now being used for the alternate frequency.

Die Pad Description

Note:

Active die size:
 X = 55.9 mils / 1420.1 μm
 Y = 40.9 mils / 1039.4 μm
 Scribe:
 X (horizontal) = 3.1 mils / 80 μm
 Y (vertical) = 3.1 mils / 80 μm
 Bond pad opening: 85 μm x 85 μm
 Pad pitch: 125 μm x 125 μm
 (pad center to pad center)
 Bottom side of Die can be connected to V_{SS} or can be isolated. Do not connect to V_{DD}.

Die Pad Summary

Name	Die Pad	X Coordinate (μm)	Y Coordinate (μm)	Description
V _{DD}	1, 2	124.7	855.6, 731	Voltage supply
V _{SS}	8, 9	1291.35	99.6, 225.2	Ground
X _D	4	124.7	481.8	Crystal connection
X _X	3	124.7	606.4	No connect ^[1]
X _G	6	124.7	232.6	Crystal connection
PD#/OE or FS	7	124.7	108	CY2037 and CY2037-2: EPROM-programmable power-down or output enable pad CY2037-3: Frequency select. Serves as V _{PP} in programming mode for all devices
CLKOUT	11	1282.45	901.8	Clock output. Also serves as three-state input during programming.
N/C	5, 10	124.7, 1282.45	357.2, 769.4	No connect (so do not bond to these pads)

Note

1. For customers not bonding the X_D or X_G pad to external pins, an alternative bonding option would be shorting the X_x pad to the X_D pad.

EPROM Configuration Block

Table 2 summarizes the features that are configurable by EPROM. Refer “7C8038x/7C8034X Proprietary Specification” for further details. This specification can be obtained from your Cypress factory representative.

Table 2. EPROM Adjustable Features

Adjustable Features	
Adjust frequency	Feedback counter value (P)
	Reference counter value (Q)
	Output divider selection
Oscillator tuning (load capacitance values)	
Duty cycle levels (TTL or CMOS)	
Power management mode (OE or PD#)	
Power management timing (synchronous or asynchronous)	

PLL Output Frequency

CY2037 contains a high resolution PLL with 12-bit multiplier and 10-bit divider. The output frequency of the PLL is determined by the following formula:

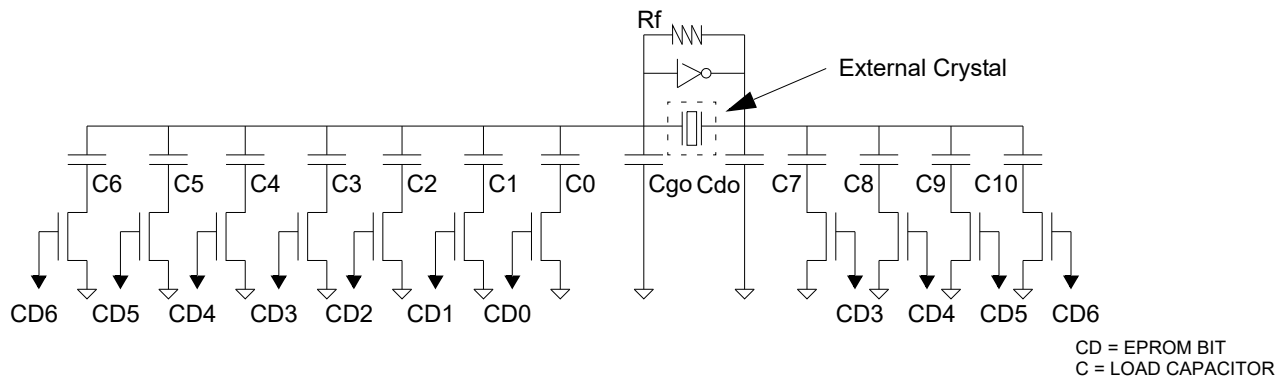

$$F_{PLL} = \frac{2 \cdot (P + 5)}{(Q + 2)} \cdot F_{REF}$$

In this formula, P is the feedback counter value and Q is the reference counter value. P and Q are EPROM programmable values.

Crystal Oscillator Tuning Circuit

CY2037 contains a unique tuning circuit to fine-tune the output frequency of the device. The tuning circuit consists of an array of eleven load capacitors on both sides of the oscillator drive inverter. The capacitor load values are EPROM-programmable and may be increased in small increments. As the capacitor load is increased the circuit is fine-tuned to a lower frequency. The capacitor load values vary from 0.17 pF to 8 pF for a 100:1 total control ratio. The tuning increments are shown in Table 3 on page 6. Refer to “7C8038x/7C8034x Proprietary Specification” for further details.

Figure 1. Crystal Oscillator Tuning Circuit

Power Management Features

CY2037 contains EPROM-programmable PD# and OE functions. If power-down (PD#) is selected, all active circuitry on the chip is shut down, output is tri-stated and pulled low by a weak pull-down when the control pin goes LOW. The weak pull-down is easily overdriven by another active CLKOUT for applications that require multiple CLKOUTs on a single signal path. The oscillator and PLL circuits must relock when the part leaves the power-down mode. If output enable (OE) mode is selected, the output is tri-stated and weakly pulled low when the control pin goes low. In this mode the oscillator and PLL circuits continue to operate, allowing a rapid return to normal operation when the control input is deasserted.

In addition, the PD# and OE modes can be programmed to occur synchronously or asynchronously with respect to the output signal. When the asynchronous setting is used, the power-down or output disable occurs immediately (allowing for logic delays), regardless of the position in the clock cycle. However, when the synchronous setting is used, the part waits for a falling edge at the output before the power-down or output enable signal is initiated, thus preventing output glitches. In asynchronous or synchronous setting, the output is always enabled synchronously by waiting for the next falling edge of the output.

Table 3. Crystal Oscillator Parameter

Parameter	Description	Min	Typ	Max	Unit
R _f	Feedback resistor, V _{DD} = 4.5 V to 5.5 V	0.5	2	3.5	MΩ
	Feedback resistor, V _{DD} = 2.7 V to 3.6 V	1.0	4	9.0	MΩ
Capacitors have ± 20% tolerance					
C _g	Gate capacitor	–	13	–	pF
C _d	Drain capacitor	–	9	–	pF
C ₀	Series capacitor	–	0.27	–	pF
C ₁	Series capacitor	–	0.52	–	pF
C ₂	Series capacitor	–	1.00	–	pF
C ₃	Series capacitor	–	0.7	–	pF
C ₄	Series capacitor	–	1.4	–	pF
C ₅	Series capacitor	–	2.6	–	pF
C ₆	Series capacitor	–	5.0	–	pF
C ₇	Series capacitor	–	0.45	–	pF
C ₈	Series capacitor	–	0.85	–	pF
C ₉	Series capacitor	–	1.7	–	pF
C ₁₀	Series capacitor	–	3.3	–	pF

CY2037 Vs CY2037-2

CY2037 contains a shadow register in addition to the EPROM register. The shadow register is an exact copy of the EPROM register and is the default register when the valid bit is not set. It is useful when the prototype or production environment calls for measuring and adjusting the CLKOUT frequency several times. Multiple adjustments can be performed with the shadow register. After the required frequency is achieved the EPROM register is permanently programmed.

Some production flows do not require the use of the shadow register. If this is the case, then CY2037-2 is the chosen device and CY2037-2 has a disabled shadow register. CY2037-3 contains the shadow register.

Frequency Select Feature of CY2037-3

CY2037-3 contains a frequency select function in place of the power-down and the output enable functions. With the frequency select feature, customers can switch two different frequencies that are configured in the two EPROM rows. Table 4 lists the definition of the frequency select pin (FS).

Table 4. Frequency Select Pin Decoding for CY2037-3

FS Pin	Output Frequency
0	From EPROM row 0 configuration
1	From EPROM row 1 configuration

Inkless Die Pick Map (DPM) Format

Cypress ships inkless wafers to customers with an accompanying die pick map, which is used to determine the good die for assembly and programming. Customers can also access individual DPM files at their convenience through ftp.cypress.com with a valid user account login and password. Contact your local Cypress Field Application Engineer (FAE) or sales representative for a customer FTP account. The DPM files are named with the fab lot number and wafer number scribed on the wafer. The DPM files are transferred to the customer's FTP account when the factory ships out the wafers against their purchase order (PO).

Absolute Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.^[2]

Supply voltage -0.5 V to +7.0 V

Input voltage -0.5 V to $V_{DD} + 0.5 V$

Storage temperature (non-condensing) 55 °C to +150 °C

Junction temperature -40 °C to +100 °C

Static discharge voltage
(per MIL-STD-883, method 3015) 2000 V

Operating Conditions

Parameter	Description	Min	Max	Unit
V_{DD}	Supply voltage (3.3 V) Supply voltage (5.0 V)	2.7 4.5	3.6 5.5	V V
T_{AJ} ^[3]	Operating temperature, Junction	-10	+100	°C
C_{TTL}	Max. capacitive load on outputs for TTL levels $V_{DD} = 4.5 V$ to $5.5 V$, output frequency = 1 MHz to 40 MHz $V_{DD} = 4.5 V$ to $5.5 V$, output frequency = 40 MHz to 133 MHz	-	50 25	pF pF
C_{CMOS}	Max. capacitive load on outputs for CMOS levels $V_{DD} = 4.5 V$ to $5.5 V$, output frequency = 1 MHz to 66.6 MHz $V_{DD} = 4.5 V$ to $5.5 V$, output frequency = 66.6 MHz to 133 MHz $V_{DD} = 3.0 V$ to $3.6 V$, output frequency = 1 MHz to 40 MHz $V_{DD} = 3.0 V$ to $3.6 V$, output frequency = 40 MHz to 100 MHz $V_{DD} = 2.7 V$ to $3.0 V$, output frequency = 1 MHz to 66 MHz	-	50 25 30 15 15	pF pF pF pF pF
X_{REF}	Reference frequency, input crystal. Fundamental tuned crystals only	10	30	MHz
t_{PU}	Power up time for all V_{DD} 's to reach minimum specified voltage (power ramps must be monotonic)	0.05	50	ms

Notes

- 2. Stresses greater than listed can impair the life of the device.
- 3. This product is sold in die form so operating conditions are specified for the die, or junction temperature.

Electrical Characteristics

Over the Operating Range

Parameter ^[4]	Description	Test Conditions	Min	Typ	Max	Unit
V _{IL}	Low-level input voltage	V _{DD} = 4.5 V to 5.5 V V _{DD} = 2.7 V to 3.6 V	–	–	0.8 0.2 × V _{DD}	V V

Document Title: CY2037, High-Accuracy EPROM-Programmable PLL Die for Crystal Oscillators				
Document Number: 38-07354				
Revision	ECN	Orig. of Change	Submission date	Description of Change
**	112248	DSG	03/01/2002	Changed from Spec number: 38-00679 to 38-07354.
*A	121857	RBI	12/14/2002	Updated Operating Conditions : Added t _{PU} parameter and its details.
*B	291092	RGL	11/18/2004	Updated Absolute Maximum Ratings : Replaced “-40°C to +100°C” with “-10°C to +100°C” in ratings corresponding to “Junction Temperature”.
*C	522769	RGL	10/18/2006	Added CY2037B related information in all instances across the document. Added Die Pad Description . Updated Absolute Maximum Ratings : Replaced “-10°C to +100°C” with “-40°C to +100°C” in ratings corresponding to “Junction Temperature”. Updated Ordering Information : Updated part numbers.
*D	804376	RGL	02/26/2007	Minor Change: Post to external web.
*E	2192266	DPF / PYRS	03/11/2008	Added Inkless Die Pick Map (DPM) Format . Updated Ordering Information : Updated part numbers.
*F	2748211	TSAI	08/10/2009	Minor Change: Post to external web.
*G	2761988	KVM	09/14/2009	Updated Ordering Information : Removed the column “Status”. Updated part numbers. Added Note “Not for new designs. New designs should use inkless wafer ordering codes.” and referred in some MPNs. Added Note “Not for new designs. New designs should use CY2037B WAF-IL.” and referred in some MPNs.
*H	2906472	CXQ	04/07/2010	Updated Ordering Information : Updated part numbers.
*I	3022612	BASH	09/03/2010	Removed CY2037A part related information in all instances across the document. Updated Features : Replaced “Sixteen selectable post divide options” with “Eight selectable post divide options”. Updated Die Pad Description . Updated Crystal Oscillator Tuning Circuit : Updated Figure 1 (Removed “T” for Transistor). Updated Electrical Characteristics : Removed I _{OE_CLKOUT} parameter and its details. Added I _{PD_CLOCKOUT} parameter and its details. Updated Switching Waveforms : Added Figure 6 . Added Figure 7 . Updated Ordering Information : Updated part numbers. Added Ordering Code Definitions . Added Acronyms, Reference Documents and Units of Measure . Completing Sunset Review.
*J	3069175	BASH	10/25/2010	Updated Die Pad Description : Removed CY2037B. Updated Ordering Information : Updated part numbers.

Document History Page *(continued)*

Document Title: CY2037, High-Accuracy EPROM-Programmable PLL Die for Crystal Oscillators				
Document Number: 38-07354				
Revision	ECN	Orig. of Change	Submission date	Description of Change
*K	4175824	CINM	11/13/2013	Updated Die Pad Description . Updated Ordering Information : Updated part numbers. Updated to new template. Completing Sunset Review.
*L	4575273	CINM	11/20/2014	Updated Functional Description : Added "For a complete list of related documentation, click here ." at the end.
*M	5542641	TAVA	12/05/2016	Updated to new template. Completing Sunset Review.
*N	6011854	PAWK	01/03/2018	Updated Ordering Information : Updated part numbers. Updated to new template.

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives, and distributors. To find the office closest to you, visit us at [Cypress Locations](#).
