PRELIMINARY

CY14E104L/CY14E104N

4 Mbit (512K x 8/256K x 16) nvSRAM

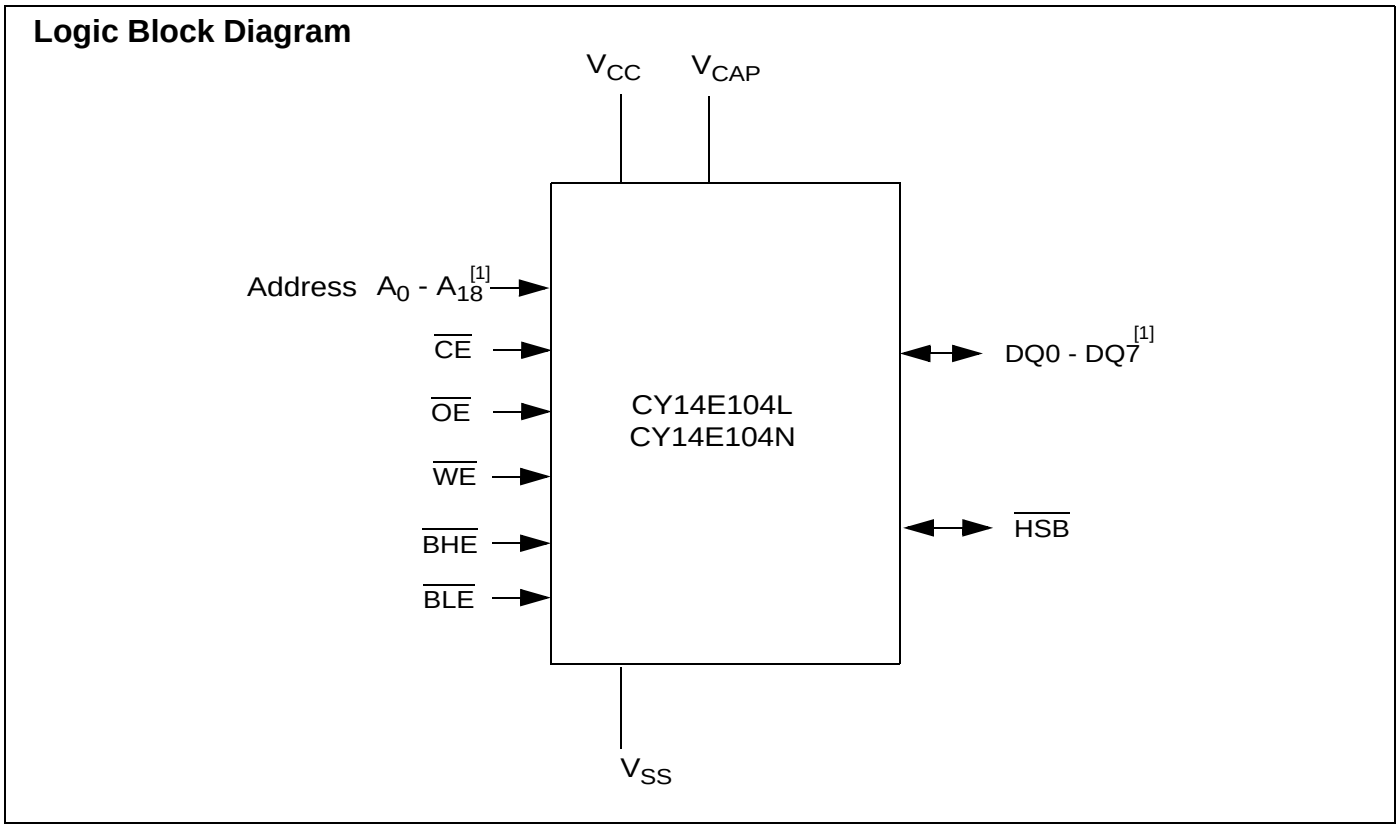
Features

- 15 ns, 20 ns, 25 ns, and 45 ns access times
- Internally organized as 512K x 8 (CY14E104L) or 256K x 16 (CY14E104N)
- Hands off automatic STORE on power down with only a small capacitor
- STORE to QuantumTrap® nonvolatile elements is initiated by software, device pin, or AutoStore® on power down
- RECALL to SRAM initiated by software or power up
- Infinite read, write, and recall cycles
- 200,000 STORE cycles to QuantumTrap
- 20 year data retention
- Single 5V ±10% operation
- Commercial and industrial temperatures
- 48-pin FBGA and 44/54-pin TSOP II packages
- Pb-free and RoHS compliance

Functional Description

The Cypress CY14E104L/CY14E104N is a fast static RAM with a nonvolatile element in each memory cell. The memory is organized as 512K words of 8 bits each or 256K words of 16 bits each. The embedded nonvolatile elements incorporate QuantumTrap technology producing the world's most reliable nonvolatile memory. The SRAM provides infinite read and write cycles, while independent nonvolatile data resides in the reliable QuantumTrap cell. Data transfers from the SRAM to the nonvolatile elements (the STORE operation) takes place automatically at power down. On power up, data is restored to the SRAM (the RECALL operation) from the nonvolatile memory. Both the STORE and RECALL operations are also available under software control.

Logic Block Diagram



Note

Pin Definitions

Pin Name	IO Type	Description
$A_0 - A_{18}$	Input	**Address Inputs Used to Select one of the 524, 288 bytes of the nvSRAM for x8 Configuration**.
$A_0 - A_{17}$		**Address Inputs Used to Select one of the 262,144 bytes of the nvSRAM for x16 Configuration**.
DQ0 – DQ7	Input/Output	**Bidirectional Data IO Lines for x8 Configuration**. Used as input or output lines depending on operation.
DQ0 – DQ15		**Bidirectional Data IO Lines for x16 Configuration**. Used as input or output lines depending on operation.
NC	No Connect	**No Connects.** This pin is not connected to the die.
$\overline{BHE}$	Input	**Byte High Enable, Active LOW**. Controls DQ15 - DQ8.
$\overline{BLE}$	Input	**Byte Low Enable, Active LOW**. Controls DQ7 - DQ0.
$\overline{WE}$	Input	**Write Enable Input, Active LOW.** When selected LOW, data on the IO pins is written to the address location latched by the falling edge of CE.
$\overline{CE}$	Input	**Chip Enable Input, Active LOW.** When LOW, selects the chip. When HIGH, deselects the chip.
$\overline{OE}$	Input	**Output Enable, Active LOW.** The active LOW $\overline{OE}$ input enables the data output buffers during read cycles. IO pins are tri-stated on deasserting $\overline{OE}$ HIGH.
V_{SS}	Ground	**Ground for the Device**. Must be connected to ground of the system.
V_{CC}	Power Supply	**Power Supply Inputs to the Device**.
$\overline{HSB}$	Input/Output	**Hardware Store Busy (HSB)**. When LOW this output indicates that a hardware store is in progress. When pulled LOW external to the chip it initiates a nonvolatile STORE operation. A weak internal pull up resistor keeps this pin HIGH if not connected (connection optional).
V_{CAP}	Power Supply	**AutoStore Capacitor**. Supplies power to the nvSRAM during power loss to store data from SRAM to nonvolatile elements.

Device Operation

The CY14E104L/CY14E104N nvSRAM is made up of two functional components paired in the same physical cell. They are an SRAM memory cell and a nonvolatile QuantumTrap cell. The SRAM memory cell operates as a standard fast static RAM. Data in the SRAM is transferred to the nonvolatile cell (the STORE operation), or from the nonvolatile cell to the SRAM (the RECALL operation). Using this unique architecture, all cells are stored and recalled in parallel. During the STORE and RECALL operations, the SRAM read and write operations are inhibited. The CY14E104L/CY14E104N supports infinite reads and writes similar to a typical SRAM. In addition, it provides infinite RECALL operations from the nonvolatile cells and up to 200K STORE operations.

SRAM Read

The CY14E104L/CY14E104N performs a read cycle when $\overline{CE}$ and $\overline{OE}$ are LOW and $\overline{WE}$ and $\overline{HSB}$ are HIGH. The address specified on pins A_{0-18} or A_{0-17} determines which of the 524,288 data bytes or 262,144 words of 16 bits each are accessed. When the read is initiated by an address transition, the outputs are valid after a delay of t_{AA} (read cycle #1). If the read is initiated by $\overline{CE}$ or $\overline{OE}$, the outputs are valid at t_{ACE} or at t_{DOE}, whichever is later (read cycle #2). The data output repeatedly responds to address changes within the t_{AA} access time without the need for transitions on any control input pins. This remains valid until another address change or until $\overline{CE}$ or $\overline{OE}$ is brought HIGH, or $\overline{WE}$ or $\overline{HSB}$ is brought LOW.

SRAM Write

A write cycle is performed when $\overline{CE}$ and $\overline{WE}$ are LOW and $\overline{HSB}$ is HIGH. The address inputs must be stable before entering the write cycle and must remain stable until $\overline{CE}$ or $\overline{WE}$ goes HIGH at the end of the cycle. The data on the common IO pins DQ_{0-15} are written into the memory if the data is valid t_{SD} before the end of a $\overline{WE}$ controlled write or before the end of an $\overline{CE}$ controlled write. It is recommended that $\overline{OE}$ be kept HIGH during the entire write cycle to avoid data bus contention on common IO lines. If $\overline{OE}$ is left LOW, internal circuitry turns off the output buffers t_{HZWE} after $\overline{WE}$ goes LOW.

AutoStore Operation

The CY14E104L/CY14E104N stores data to the nvSRAM using one of the following three storage operations: Hardware Store activated by $\overline{HSB}$; Software Store activated by an address sequence; AutoStore activated on device power down. The AutoStore operation is a unique feature of QuantumTrap technology and is enabled by default on the CY14E104L/CY14E104N.

During a normal operation, the device draws current from V_{CC} to charge a capacitor connected to the V_{CAP} pin. This stored charge is used by the chip to perform a single STORE operation. If the voltage on the V_{CC} pin drops below V_{SWITCH}, which is below the minimum specified operating voltage, the part automatically disconnects the V_{CAP} pin from V_{CC}. A STORE operation is initiated with power provided by the V_{CAP} capacitor.

Figure 4. AutoStore Mode

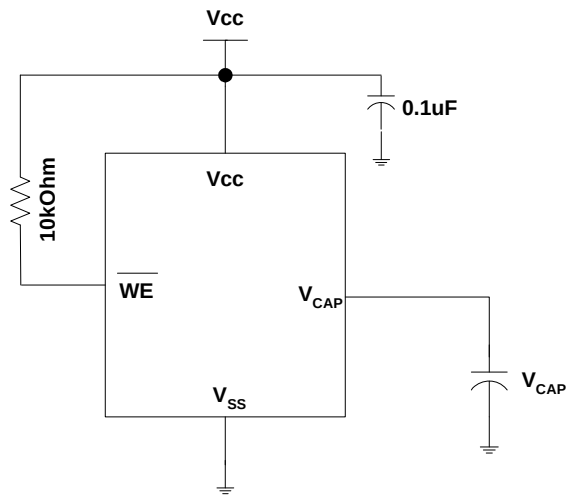

Figure 4 shows the proper connection of the storage capacitor (V_{CAP}) for automatic store operation. Refer to DC Electrical Characteristics on page 7 for the size of V_{CAP}.

To reduce unnecessary nonvolatile stores, AutoStore and hardware store operations are ignored unless at least one write operation has taken place since the most recent STORE or RECALL cycle. Software initiated STORE cycles are performed regardless of whether a write operation has taken place. The $\overline{HSB}$ signal is monitored by the system to detect if an AutoStore cycle is in progress.

Hardware STORE ($\overline{HSB}$) Operation

The CY14E104L/CY14E104N provides the $\overline{HSB}$ pin to control and acknowledge the STORE operations. The $\overline{HSB}$ pin is used to request a hardware STORE cycle. When the $\overline{HSB}$ pin is driven LOW, the CY14E104L/CY14E104N conditionally initiates a STORE operation after t_{DELAY}. An actual STORE cycle begins only if a write to the SRAM has taken place since the last STORE or RECALL cycle. The $\overline{HSB}$ pin also acts as an open drain driver that is internally driven LOW to indicate a busy condition when the STORE (initiated by any means) is in progress.

SRAM read and write operations that are in progress when $\overline{HSB}$ is driven LOW by any means are given time to complete before the STORE operation is initiated. After $\overline{HSB}$ goes LOW, the CY14E104L/CY14E104N continues SRAM operations for t_{DELAY}. During t_{DELAY}, multiple SRAM read operations may take place. If a write is in progress when $\overline{HSB}$ is pulled LOW it is allowed a time, t_{DELAY}, to complete. However, any SRAM write cycles requested after $\overline{HSB}$ goes LOW are inhibited until $\overline{HSB}$ returns HIGH.

During any STORE operation, regardless of how it is initiated, the CY14E104L/CY14E104N continues to drive the $\overline{HSB}$ pin LOW, releasing it only when the STORE is complete. Upon completion of the STORE operation, the CY14E104L/CY14E104N remains disabled until the $\overline{HSB}$ pin returns HIGH. Leave the $\overline{HSB}$ unconnected if it is not used.

Hardware RECALL (Power Up)

During power up or after any low power condition (V_{CC} < V_{SWITCH}), an internal RECALL request is latched. When V_{CC} exceeds the sense voltage of V_{SWITCH}, a RECALL cycle is automatically initiated and takes $t_{HRECALL}$ to complete.

Software STORE

Data is transferred from the SRAM to the nonvolatile memory by a software address sequence. The CY14E104L/CY14E104N software STORE cycle is initiated by executing sequential $\overline{CE}$ controlled read cycles from six specific address locations in exact order. During the STORE cycle an erase of the previous nonvolatile data is first performed, followed by a program of the nonvolatile elements. After a STORE cycle is initiated, further input and output are disabled until the cycle is completed.

Because a sequence of reads from specific addresses is used for STORE initiation, it is important that no other read or write accesses intervene in the sequence, or the sequence is aborted and no STORE or RECALL takes place.

To initiate the software STORE cycle, the following read sequence must be performed.

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x8FC0 Initiate STORE cycle

The software sequence may be clocked with $\overline{CE}$ controlled reads or $\overline{OE}$ controlled reads. After the sixth address in the sequence is entered, the STORE cycle commences and the chip is disabled. It is important to use read cycles and not write cycles in the sequence, although it is not necessary that $\overline{OE}$ be LOW for a valid sequence. After the t_{STORE} cycle time is fulfilled, the SRAM is activated again for a read and write operation.

Software RECALL

Data is transferred from the nonvolatile memory to the SRAM by a software address sequence. A software RECALL cycle is initiated with a sequence of read operations in a manner similar to the software STORE initiation. To initiate the RECALL cycle, the following sequence of $\overline{CE}$ controlled read operations must be performed.

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x4C63 Initiate RECALL cycle

Internally, RECALL is a two step procedure. First, the SRAM data is cleared; then, the nonvolatile information is transferred into the SRAM cells. After the t_{RECALL} cycle time, the SRAM is again ready for read and write operations. The RECALL operation does not alter the data in the nonvolatile elements.

Table 1. Mode Selection

$\overline{CE}$	$\overline{WE}$	$\overline{OE}$	A15 - A0	Mode	IO	Power
H	X	X	X	Not Selected	Output High Z	Standby
L	H	L	X	Read SRAM	Output Data	Active
L	L	X	X	Write SRAM	Input Data	Active
L	H	L	0x4E38 0xB1C7 0x83E0 0x7C1F 0x703F 0x8B45	Read SRAM Read SRAM Read SRAM Read SRAM Read SRAM AutoStore Disable	Output Data Output Data Output Data Output Data Output Data Output Data	Active[4,5,6]
L	H	L	0x4E38 0xB1C7 0x83E0 0x7C1F 0x703F 0x4B46	Read SRAM Read SRAM Read SRAM Read SRAM Read SRAM AutoStore Enable	Output Data Output Data Output Data Output Data Output Data Output Data	Active[4,5,6]

Notes
4. The six consecutive address locations must be in the order listed. $\overline{WE}$ must be HIGH during all six cycles to enable a nonvolatile cycle.
5. While there are 19 address lines on the CY14E104L/CY14E104N, only the lower 16 lines are used to control software modes.
6. IO state depends on the state of $\overline{OE}$, $\overline{BHE}$, and $\overline{BLE}$. The IO table shown assumes $\overline{OE}$, $\overline{BHE}$, and $\overline{BLE}$ LOW.

Table 1. Mode Selection (continued)

$\overline{CE}$	$\overline{WE}$	$\overline{OE}$	A15 - A0	Mode	IO	Power

Preventing AutoStore

The AutoStore function is disabled by initiating an AutoStore disable sequence. A sequence of read operations is performed in a manner similar to the software STORE initiation. To initiate the AutoStore disable sequence, the following sequence of $\overline{CE}$ controlled read operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x8B45 AutoStore Disable

The AutoStore is re-enabled by initiating an AutoStore enable sequence. A sequence of read operations is performed in a manner similar to the software RECALL initiation. To initiate the AutoStore enable sequence, the following sequence of $\overline{CE}$ controlled read operations must be performed:

1. Read address 0x4E38 Valid READ
2. Read address 0xB1C7 Valid READ
3. Read address 0x83E0 Valid READ
4. Read address 0x7C1F Valid READ
5. Read address 0x703F Valid READ
6. Read address 0x4B46 AutoStore Enable

If the AutoStore function is disabled or re-enabled, a manual STORE operation (hardware or software) must be issued to save the AutoStore state through subsequent power down cycles. The part comes from the factory with AutoStore enabled.

Data Protection

The CY14E104L/CY14E104N protects data from corruption during low voltage conditions by inhibiting all externally initiated STORE and write operations. The low voltage condition is detected when $V_{CC} < V_{SWITCH}$. If the CY14E104L/ CY14E104N is in a write mode (both $\overline{CE}$ and $\overline{WE}$ are LOW) at power up, after a RECALL or STORE, the write is inhibited until a negative transition on $\overline{CE}$ or $\overline{WE}$ is detected. This protects against inadvertent writes during power up or brown out conditions.

Noise Considerations

Refer CY application note AN1064.

Maximum Ratings

Exceeding maximum ratings may impair the useful life of the device. These user guidelines are not tested.

Storage Temperature ..... –65°C to +150°C

Ambient Temperature with Power Applied ..... –55°C to +150°C

Supply Voltage on V_{CC} Relative to GND .....–0.5V to 7.0V

Voltage Applied to Outputs in High-Z State..... –0.5V to V_{CC} + 0.5V

Input Voltage.....–0.5V to Vcc+0.5V

Transient Voltage (<20 ns) on Any Pin to Ground Potential ..... –2.0V to V_{CC} + 2.0V

Package Power Dissipation Capability (T_A = 25°C) 1.0W

Surface Mount Pb Soldering Temperature (3 Seconds) ..... +260°C

Output Short Circuit Current [7]..... 15 mA

Static Discharge Voltage..... > 2001V (per MIL-STD-883, Method 3015)

Latch Up Current ..... > 200 mA

Operating Range

Range	Ambient Temperature	V_{CC}
Commercial	0°C to +70°C	4.5V to 5.5V
Industrial	–40°C to +85°C	4.5V to 5.5V

DC Electrical Characteristics

Over the Operating Range (V_{CC} = 4.5V to 5.5V) [9]

Parameter	Description	Test Conditions		Min	Max	Unit
I_{CC1}	Average V_{CC} Current	t_{RC} = 15 ns t_{RC} = 20 ns t_{RC} = 25 ns t_{RC} = 45 ns Dependent on output loading and cycle rate.Values obtained without output loads. I_{OUT} = 0 mA	Commercial		70 65 65 50	mA mA mA
			Industrial		75 70 70 52	mA mA mA
I_{CC2}	Average V_{CC} Current during STORE	All Inputs Don't Care, V_{CC} = Max. Average current for duration t_{STORE}			6	mA
I_{CC3}[8]	Average V_{CC} Current at t_{RC}= 200 ns, 5V, 25°C typical	$\overline{WE}$ > (V_{CC} – 0.2). All other I/P cycling. Dependent on output loading and cycle rate. Values obtained without output loads.			35	mA
I_{CC4}	Average V_{CAP} Current during AutoStore Cycle	All Inputs Don't Care, V_{CC} = Max. Average current for duration t_{STORE}			6	mA
I_{SB}	V_{CC} Standby Current	$\overline{CE}$ > (V_{CC} – 0.2). All others V_{IN} < 0.2V or > (V_{CC} – 0.2V). Standby current level after nonvolatile cycle is complete. Inputs are static. f = 0 MHz.			3	mA
I_{IX}	Input Leakage Current (except $\overline{HSB}$)	V_{CC} = Max, $V_{SS} \le V_{IN} \le V_{CC}$		–1	+1	µA
	Input Leakage Current (for $\overline{HSB}$)	V_{CC} = Max, $V_{SS} \le V_{IN} \le V_{CC}$		–100	+1	µA
I_{OZ}	Off-State Output Leakage Current	V_{CC} = Max., $V_{SS} \le V_{IN} \le V_{CC}$, $\overline{CE}$ or $\overline{OE}$ > V_{IH}		–1	+1	µA
V_{IH}	Input HIGH Voltage			2.2	V_{CC} + 0.5	V
V_{IL}	Input LOW Voltage			V_{ss} – 0.5	0.8	V
V_{OH}	Output HIGH Voltage	I_{OUT} = –2 mA		2.4		V
V_{OL}	Output LOW Voltage	I_{OUT} = 4 mA			0.4	V
V_{CAP}	Storage Capacitor	Between V_{CAP} pin and V_{SS}, 5V Rated		61	82	µF

Notes
7. Outputs shorted for no more than one second. Only one output shorted at a time.
8. Typical conditions for the active current shown on the front page of the data sheet are average values at 25°C (room temperature), and V_{CC} = 5V. Not 100% tested.
9. The $\overline{HSB}$ pin has I_{OUT}=-10 uA for V_{OH} of 2.4V.This parameter is characterized but not tested.

Capacitance

In the following table, the capacitance parameters are listed.[10]

Parameter	Description	Test Conditions	Max	Unit
C_{IN}	Input Capacitance	T_A = 25°C, f = 1 MHz, V_{CC} = 0 to 3.0V	7	pF
C_{OUT}	Output Capacitance		7	pF

Thermal Resistance

In the following table, the thermal resistance parameters are listed.[10]

Parameter	Description	Test Conditions	48-FBGA	44-TSOP II	54-TSOP II	Unit
Θ_{JA}	Thermal Resistance (Junction to Ambient)	Test conditions follow standard test methods and procedures for measuring thermal impedance, in accordance with EIA/JESD51.	28.82	31.11	30.73	°C/W
Θ_{JC}	Thermal Resistance (Junction to Case)		7.84	5.56	6.08	°C/W

AutoStore/Power Up RECALL

Parameters	Description	CY14E104L/CY14E104N		Unit
		Min	Max	
$t_{HRECALL}$ [15]	Power Up RECALL Duration		20	ms
t_{STORE} [16]	STORE Cycle Duration		15	ms
V_{SWITCH}	Low Voltage Trigger Level		4.4	V
$t_{VCCRISE}$	VCC Rise Time	150		µs

Notes
14. If $\overline{WE}$ is low when $\overline{CE}$ goes low, the outputs remain in the high impedance state.
15. $t_{HRECALL}$ starts from the time V_{CC} rises above V_{SWITCH}.
16. If an SRAM write has not taken place since the last nonvolatile cycle, no STORE takes place.

Software Controlled STORE/RECALL Cycle

In the following table, the software controlled STORE/RECALL cycle parameters are listed. [17, 18]

Parameters	Description	15 ns		20 ns		25 ns		45 ns		Unit
		Min	Max	Min	Max	Min	Max	Min	Max	
t_{RC}	STORE/RECALL Initiation Cycle Time	15		20		25		45		ns
t_{AS}	Address Setup Time	0		0		0		0		ns
t_{CW}	Clock Pulse Width	12		15		20		30		ns
t_{GHAX}	Address Hold Time	1		1		1				ns
t_{RECALL}	RECALL Duration		200		200		200		200	µs
t_{SS} [19, 20]	Soft Sequence Processing Time		70		70		70		70	µs

Hardware STORE Cycle

Parameters	Description	CY14E104L/CY14E104N		Unit
		Min	Max	
t_{DELAY} [21]	Time Allowed to Complete SRAM Cycle	1	70	µs
t_{HLHX}	Hardware STORE Pulse Width	15		ns

Notes

17. The software sequence is clocked with $\overline{CE}$ controlled or $\overline{OE}$ controlled reads.
18. The six consecutive addresses must be read in the order listed in the Table 1 on page 5. $\overline{WE}$ must be HIGH during all six consecutive cycles.
19. This is the amount of time it takes to take action on a soft sequence command. Vcc power must remain HIGH to effectively register command.
20. Commands such as STORE and RECALL lock out IO until operation is complete which further increases this time. See the specific command.
21. On a hardware STORE initiation, SRAM operation continues to be enabled for time t_{DELAY} to allow read and write cycles to complete.

Switching Waveforms

Figure 6. SRAM Read Cycle #1: Address Controlled [11, 12, 22]

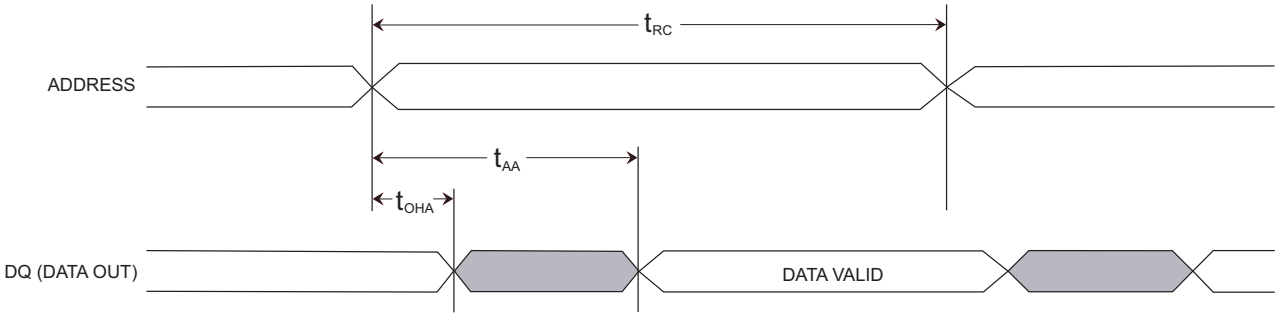

Figure 7. SRAM Read Cycle #2: $\overline{CE}$ and $\overline{OE}$ Controlled [11, 22, 23]

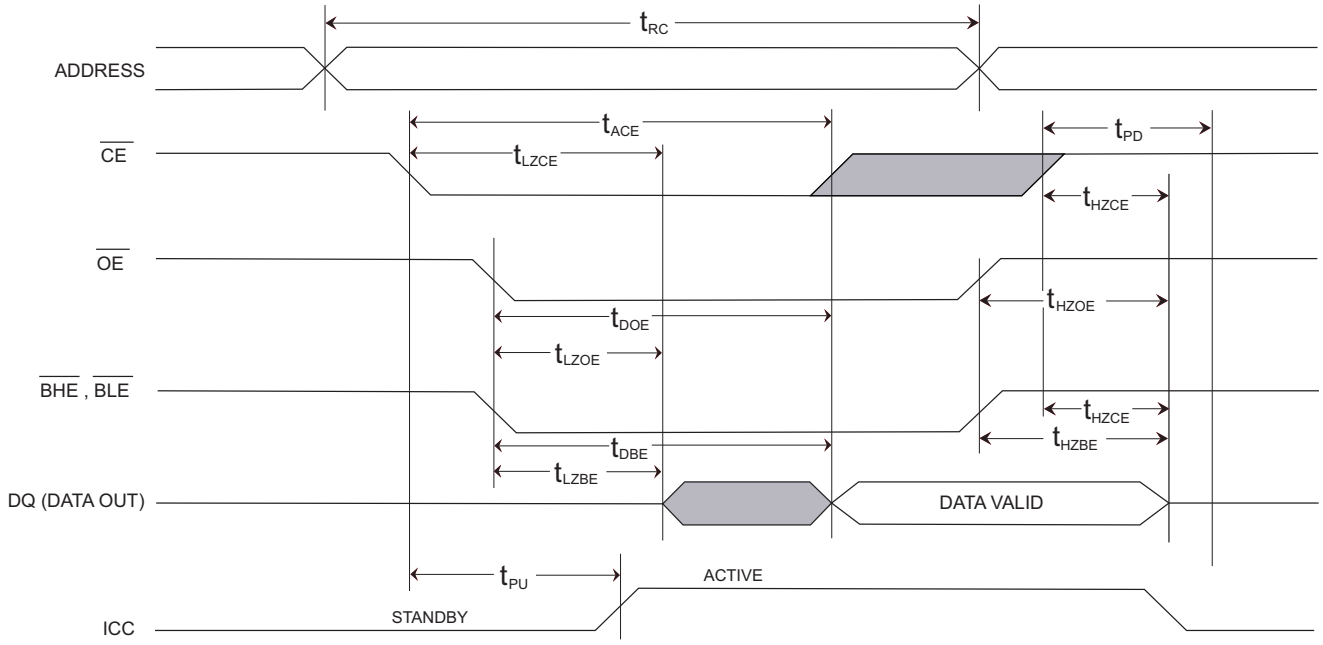

Notes
22. $\overline{HSB}$ must remain HIGH during read and write cycles.
23. $\overline{BHE}$ and $\overline{BLE}$ are applicable for x16 configuration only.

Switching Waveforms (continued)

Figure 8. SRAM Write Cycle #1: $\overline{WE}$ Controlled[14, 22, 23, 24]

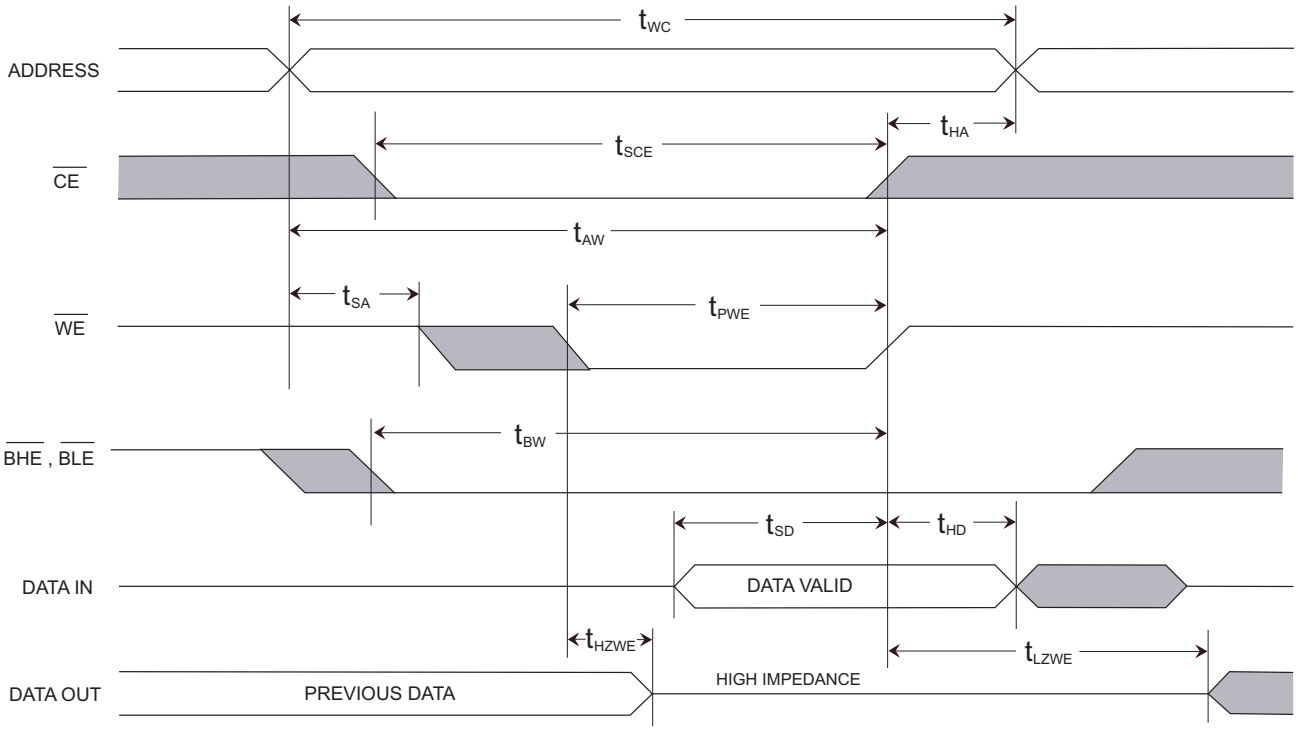

Figure 9. SRAM Write Cycle #2: $\overline{CE}$ Controlled[14, 22, 23, 24]

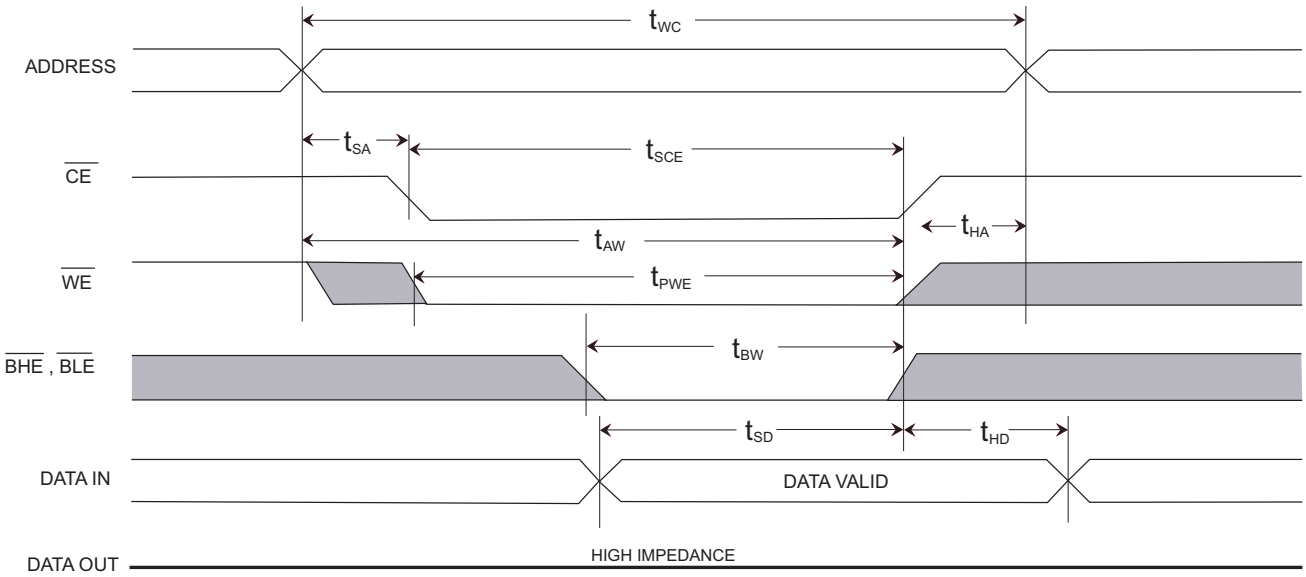

Note
24. $\overline{CE}$ or $\overline{WE}$ must be $\geq V_{IH}$ during address transitions.

Switching Waveforms (continued)

Document History Page

Document Title: CY14E104L/CY14E104N 4 Mbit (512K x 8/256K x 16) nvSRAM Document Number: 001-09603				
Rev.	**ECN No.**	**Submission Date**	**Orig. of Change**	**Description of Change**
**	493192	See ECN	TUP	New Data Sheet
*A	499597	See ECN	PCI	Removed 35 ns speed bin Added 55 ns speed bin. Updated AC table for the same Changed “Unlimited” read/write to “infinite” read/write Features section: Changed typical I_{CC} at 200-ns cycle time to 8 mA Changed STORE cycles from 500K to 200K cycles Shaded Commercial grade in operating range table Modified Icc/Isb specs Corrected Vcc from 3.0v to 5.5v in the Low Average Active Power description section 48 FBGA package nomenclature changed from BW to BV Modified part nomenclature table. Changes reflected in the ordering information table
*B	517928	See ECN	TUP	Removed 55ns speed bin Changed pinout for 44TSOPII and 54TSOPII Packages. Changed I_{SB} to 1mA Changed I_{CC4} to 3mA Changed V_{CAP} min to 35µF Changed t_{STORE} to 15ns Changed t_{PWE} to 10ns Changed t_{SCE} to 15ns Changed t_{SD} to 5ns Changed t_{AW} to 10ns Removed t_{HLBL} Added Timing Parameters for $\overline{BHE}$ and $\overline{BLE}$ - t_{DBE}, t_{LZBE}, t_{HZBE}, t_{BW} Removed min. specification for Vswitch Changed t_{GLAX} to 1ns Added t_{DELAY} max. of 70us Changed t_{SS} specification from 70us min. to 70us max.
*C	774157	See ECN	UHA	Changed the data sheet from Advance information to Preliminary 48 FBGA package code changed from BV to BA Removed 48 FBGA package in X8 configuration in ordering information. Changed t_{DBE} to 10ns in 15ns part Changed t_{HZBE} in 15ns part to 7ns and in 25ns part to10ns Changed t_{BW} in 15ns part to 15ns and in 25ns part to 20ns Changed t_{GLAX} to t_{GHAX} Changed the value of I_{CC3} to 25mA Changed the value of t_{AW} in 15ns part to 15ns Changed A_{18} and A_{19} Pins in FBGA Pin Configuration to NC In AC test loads changed the value of R1 to 963Ω and R2 to 512Ω
*D	914280	See ECN	UHA	Included all the information for 45 ns part in this data sheet
*E	1890926	See ECN	vsutmp8/AESA	Updated logic block diagram Updated Pin definition table Added Footnote 1, 2 and 3. Added 48-FBGA (X8) Pin Diagram Changed 8Mb Address expansion Pin from Pin 43 to Pin 42 for 44-TSOP II (x8) package. Corrected typo in V_{IL} min spec Changed Vswitch value from 2.65V to 4.4V Changed the value of I_{CC3} from 25mA to 13mA Changed I_{SB} value from 1mA to 2mA Updated ordering information table Rearranging of Footnotes.

Document Title: CY14E104L/CY14E104N 4 Mbit (512K x 8/256K x 16) nvSRAM Document Number: 001-09603				
Rev.	**ECN No.**	**Submission Date**	**Orig. of Change**	**Description of Change**
*F	2267286	See ECN	GVCH/PYRS	Updated Figure 4 (Autostore mode) Changed I_{CC2} & I_{CC4} from 3mA to 6mA. Changed I_{CC3} from 13mA to 15mA Changed I_{SB} from 2mA to 3mA Added input leakage current (I_{IX}) for $\overline{HSB}$ in DC Electrical Characteristics table Changed Vcap from 35uF min and 57uF max value to 54uF min and 82uF max value Corrected typo in t_{HZCE} and t_{HZOE} min spec and added max value15ns for 45ns part Corrected typo in t_{PU} max spec and added min value 0ns for 45ns part Corrected typo in t_{AW} value from 15ns to 10ns for 15ns part Changed tRECALL from 100us to 200us Added t_{RECALL} and t_{SS} max value for 45ns part in Software controlled STORE/RECALL Cycle table Reframed footnote 6, 14 and 21. Added footnote 9 and 25 Added footnote 14 to figure 7 and footnote 14, 22 and 24 to figure 8
*G	2483627	See ECN	GVCH/PYRS	Removed 8 mA typical I_{CC} at 200 ns cycle time in Feature section Referenced footnote 8 to I_{CC3} in DC Characteristics table Changed I_{CC3} from 15 mA to 35 mA Changed Vcap minimum value from 54uF to 61uF. Changed t_{AVAV} to t_{RC} Figure 11:Changed t_{SA} to t_{AS} and $t_{SCE\ to}$ t_{CW}
*H	2519319	06/20/08	GVCH/PYRS	Added 20 ns access speed in “Features” Added I_{CC1} for tRC=20 ns for both industrial and Commecial temperature Grade Updated thermal resistance values for 48-FBGA, 44-TSOP II and 54-TSOP II packages Added AC Switching Characteristics specs for 20 ns access speed Added Software controlled STORE/RECALL cycle specs for 20 ns access speed Updated ordering information and Part numbering nomenclature

Sales, Solutions, and Legal Information

Worldwide Sales and Design Support

Cypress maintains a worldwide network of offices, solution centers, manufacturer’s representatives, and distributors. To find the office closest to you, visit us at cypress.com/sales.
