Single Comparator

The TC75S57F/TC75S57FU/TC75S57FE is a CMOS general-purpose single comparator. The device can operate off a single power supply and draws a lower supply current than a conventional bipolar general-purpose comparator. This device's push-pull output stage can be directly connected to TTL or CMOS logic ICs, among others.

Features

- Low-current power supply : I_{DD} = 100 μA (typ.)
- Single power supply operation
- Wide common mode input voltage range : V_{SS}~V_{DD} − 0.9 V
- Push-pull output circuit
- Low input bias current
- Small package

Note: Using continuously under heavy loads (e.g. the application of high temperature/current/voltage and the significant change in temperature, etc.) may cause this product to decrease in the reliability significantly even if the operating conditions (i.e. operating temperature/current/voltage, etc.) are within the absolute maximum ratings and the operating ranges.
Please design the appropriate reliability upon reviewing the Toshiba Semiconductor Reliability Handbook (“Handling Precautions”/“Derating Concept and Methods”) and individual reliability data (i.e. reliability test report and estimated failure rate, etc).

Note: This device’s CMOS structure makes it prone to latch-up. To prevent latch-up, please take the following precautions:

- Ensure that no I/O pin’s voltage level ever exceeds V_{DD} or drops below V_{SS}.
  In addition, check the power-on timing.
- Do not subject the device to excessive noise.
