OPA404

AVAILABLE IN DIE

## Quad High-Speed Precision *Difet*<sup>®</sup> OPERATIONAL AMPLIFIER

### FEATURES

- WIDE BANDWIDTH: 6.4MHz
- HIGH SLEW RATE: 35V/ $\mu$ s
- LOW OFFSET:  $\pm 750\mu$ V max
- LOW BIAS CURRENT:  $\pm 4$ pA max
- LOW SETTLING: 1.5 $\mu$ s to 0.01%
- STANDARD QUAD PINOUT

### APPLICATIONS

- PRECISION INSTRUMENTATION
- OPTOELECTRONICS
- SONAR, ULTRASOUND
- PROFESSIONAL AUDIO EQUIPMENT
- MEDICAL EQUIPMENT
- DETECTOR ARRAYS

### DESCRIPTION

The OPA404 is a high performance monolithic *Difet*<sup>®</sup> (dielectrically-isolated FET) quad operational amplifier. It offers an unusual combination of very-low bias current together with wide bandwidth and fast slew rate.

Noise, bias current, voltage offset, drift, and speed are superior to BIFET<sup>®</sup> amplifiers.

Laser-trimming of thin-film resistors gives very low offset and drift—the best available in a quad FET op amp.

The OPA404's input cascode design allows high precision input specifications and uncompromised high-speed performance.

Standard quad op amp pin configuration allows upgrading of existing designs to higher performance levels. The OPA404 is unity-gain stable.

OPA404 Simplified Circuit  
(Each Amplifier)

*Difet*<sup>®</sup>, Burr-Brown Corp.

## APPLICATIONS INFORMATION

### OFFSET VOLTAGE ADJUSTMENT

The OPA404 offset voltage is laser-trimmed and will require no further trim for most applications. If desired, offset voltage can be trimmed by summing (see Figure 1). With this trim method there will be no degradation of input offset drift.

FIGURE 1. Offset Voltage Trim.

### INPUT PROTECTION

Conventional monolithic FET operational amplifiers require external current-limiting resistors to protect their inputs against destructive currents that can flow when input FET gate-to-substrate isolation diodes are forward-biased. Most BIFET amplifiers can be destroyed by the loss of  $-V_{CC}$ .

Unlike BIFET amplifiers, the *Difet* OPA404 requires input current limiting resistors only if its input voltage is greater than 8 volts more negative than  $-V_{CC}$ . A 10kΩ series resistor will limit the input current to a safe value with up to  $\pm 15V$  input levels even if both supply voltages are lost. (See Figure 2 and Absolute Maximum Ratings).

FIGURE 2. Input Current vs Input Voltage with  $\pm V_{CC}$  Pins Grounded.

Static damage can cause subtle changes in amplifier input characteristics without necessarily destroying the device. In precision operational amplifiers (both bipolar and FET types), this may cause a noticeable degradation of offset voltage and drift.

Static protection is recommended when handling any precision IC operational amplifier.

### GUARDING AND SHIELDING

As in any situation where high impedances are involved, careful shielding is required to reduce "hum" pickup in input leads. If large feedback resistors are used, they should also be shielded along with the external input circuitry.

Leakage currents across printed circuit boards can easily exceed the bias current of the OPA404. To avoid leakage, utmost care must be used in planning the board layout. A "guard" pattern should completely surround the high impedance input leads and should be connected to a low-impedance point which is at the signal input potential. (See Figure 3).

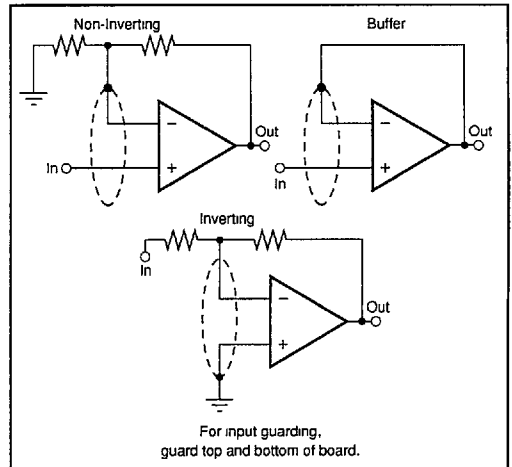

FIGURE 3. Connection of Input Guard.

### HANDLING AND TESTING

Measuring the unusually low bias current of the OPA404 is difficult without specialized test equipment; most commercial benchtop testers cannot accurately measure the OPA404 bias current. Low-leakage test sockets and special test fixtures are recommended if incoming inspection of bias current is to be performed.

To prevent surface leakage between pins, the DIP package should not be handled by bare fingers. Oils and salts from fingerprints or careless handling can create leakage currents that exceed the specified OPA404 bias currents.

## For Immediate Assistance, Contact Your Local Salesperson

If necessary, DIP packages and PC board assemblies can be cleaned with Freon TF<sup>®</sup>, baked for 30 minutes at 85°C, rinsed with de-ionized water, and baked again for 30 minutes at 85°C. Surface contamination can be prevented by the application of a high-quality conformal coating to the cleaned PC board assembly.

### BIAS CURRENT CHANGE VERSUS COMMON-MODE VOLTAGE

The input bias currents of most popular BIFET operational amplifiers are affected by common-mode voltage (Figure 4). Higher input FET gate-to-drain voltage causes leakage and ionization (bias) currents to increase. Due to its cascode input stage, the extremely-low bias current of the OPA404 is not compromised by common-mode voltage.

FIGURE 4. Input Bias Current vs Common-Mode Voltage.

### APPLICATIONS CIRCUITS

Figures 5 through 11 are circuit diagrams of various applications for the OPA404.
