CY2282-1
CY2282-11S

100-MHz Pentium® II Clock Synthesizer/Driver with Spread Spectrum and USB for Desktop PCs

Features

- Mixed 2.5V and 3.3V operation
- Clock Generator for Pentium® II, and other similar processor-based motherboards
 - Two 2.5V CPU clocks at 66.6 or 100 MHz
 - Seven 3.3V synch. PCI clocks, one free-running
 - Two 3.3V 48 MHz USB clocks
 - One 3.3V REF clock at 14.318 MHz
 - One 2.5V APIC clock at 14.318 MHz or PCI/2
- Spread spectrum clocking for EMI control (CY2282-11S only)
- Factory-EPROM programmable output drive and slew rate for EMI optimization
- Low skew outputs, ≤ 175 ps between CPU clocks
- Available in space-saving 28-pin SOIC package

Functional Description

The CY2282 is a clock synthesizer/driver for a Pentium II, or other similar processor-based PC requiring 100-MHz support. The CY2282-1 outputs two CPU clocks at 2.5V. There are seven PCI clocks, running at one-half or one-third the CPU clock frequency of 66.6 MHz and 100 MHz respectively. One of the PCI clocks is free-running. Additionally, the part outputs two

3.3V USB clocks at 48 MHz, one 3.3V reference clock at 14.318 MHz, and one 2.5V APIC clock at 14.318 MHz.

The CY2282-11S provides the same outputs as the CY2282-1 but also incorporates the Intel®-defined spread spectrum features. It provides a 0.5% downspread on the CPU and PCI clocks, which can improve EMI in certain high-speed systems. A summary of clock outputs for both devices is shown below.

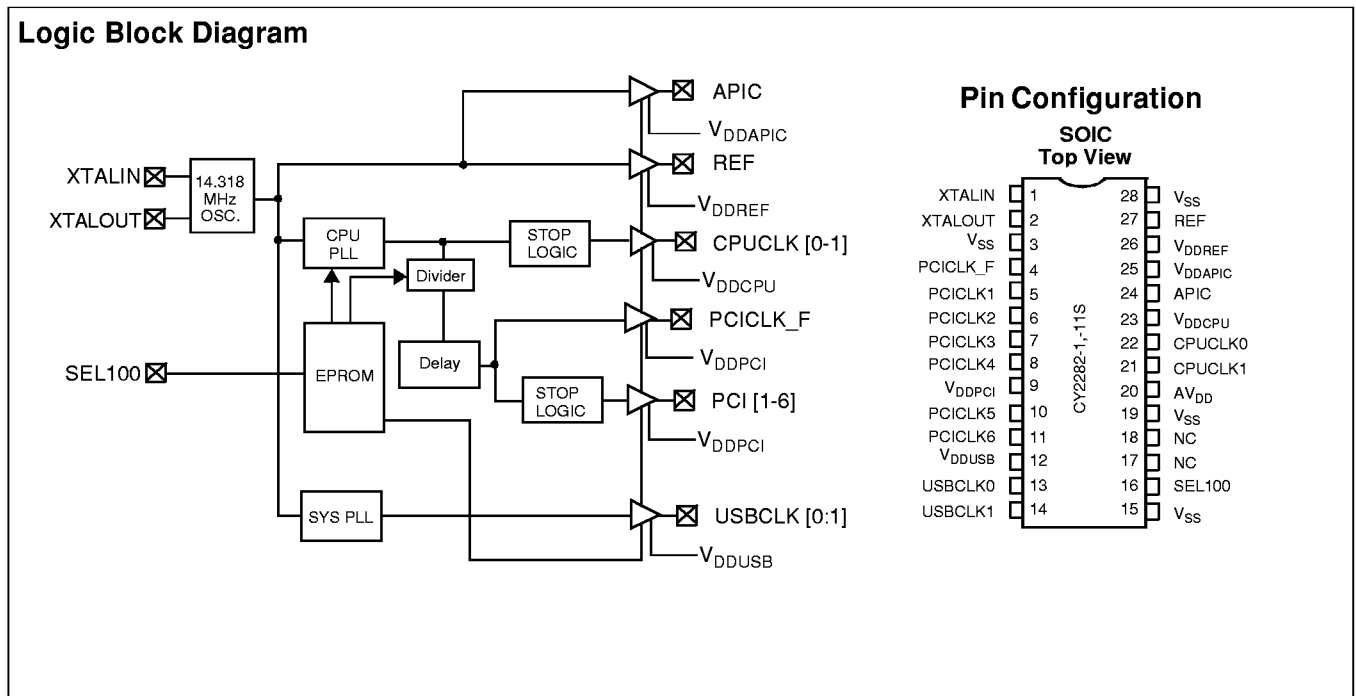

The CY2282 outputs are designed for low EMI emissions. Controlled rise and fall times, unique output driver circuits, and factory-EPROM programmable output drive and slew-rate enable optimal configurations for EMI control.

Application Information

Clock traces must be terminated with either series or parallel termination, as they are normally done.

Application Circuit

Cd = DECOUPLING CAPACITORS
 Ct = OPTIONAL EM-REDUCING CAPACITORS
 Cx = OPTIONAL LOAD MATCHING CAPACITOR
 Rs = SERIES TERMINATING RESISTORS

Summary

- A parallel-resonant crystal should be used as the reference to the clock generator. The operating frequency and CLOAD of this crystal should be as specified in the data sheet. Optional trimming capacitors may be needed if a crystal with a different CLOAD is used. Footprints must be laid out for flexibility.
- Surface mount, low-ESR, ceramic capacitors should be used for filtering. Typically, these capacitors have a value of 0.1 µF. In some cases, smaller value capacitors may be required.
- The value of the series terminating resistor satisfies the following equation, where R_{trace} is the loaded characteristic impedance of the trace, R_{out} is the output impedance of the clock generator (specified in the data sheet), and R_{series} is the series terminating resistor.

$$R_{series} > R_{trace} - R_{out}$$
- Footprints must be laid out for optional EMI-reducing capacitors, which should be placed as close to the terminating resistor as is physically possible. Typical values of these capacitors range from 4.7 pF to 22 pF.
- A Ferrite Bead **may** be used to isolate the Board VDD from the clock generator VDD island. Ensure that the Ferrite Bead offers greater than 50Ω impedance at the clock frequency, under loaded DC conditions. Please refer to the application note "Layout and Termination Techniques for Cypress Clock Generators" for more details.
- If a Ferrite Bead is used, a 10 µF–22 µF tantalum bypass capacitor should be placed close to the Ferrite Bead. This capacitor prevents power supply droop during current surges.

Test Circuit

Notes:
Each supply pin must have an individual decoupling capacitor
All capacitors must be placed as close to the pins as is possible.
