256Kx36 & 512Kx18-Bit Synchronous Burst SRAM

FEATURES

- Synchronous Operation.
- On-Chip Address Counter.
- Self-Timed Write Cycle.
- On-Chip Address and Control Registers.
- 3.3V+0.165V/-0.165V Power Supply.
- I/O Supply Voltage 3.3V+0.165V/-0.165V for 3.3V I/O or 2.5V+0.4V/-0.125V for 2.5V I/O
- 5V Tolerant Inputs Except I/O Pins.
- Byte Writable Function.
- Global Write Enable Controls a full bus-width write.
- Power Down State via ZZ Signal.
- LBO Pin allows a choice of either a interleaved burst or a linear burst.
- Three Chip Enables for simple depth expansion with No Data Contention only for TQFP.
- Asynchronous Output Enable Control.
- ADSP, ADSC, ADV Burst Control Pins.
- TTL-Level Three-State Output.
- 100-TQFP-1420A /119BGA(7x17 Ball Grid Array Package)

GENERAL DESCRIPTION

The KM736V887 and KM718V987 are 9,437,184-bit Synchronous Static Random Access Memory designed for high performance second level cache of Pentium and Power PC based System.

It is organized as 256K(512K) words of 36(18) bits and integrates address and control registers, a 2-bit burst address counter and added some new functions for high performance cache RAM applications; \overline{GW} , \overline{BW} , \overline{LBO} , ZZ. Write cycles are internally self-timed and synchronous.

Full bus-width write is done by \overline{GW} , and each byte write is performed by the combination of \overline{WEx} and \overline{BW} when \overline{GW} is high. And with $\overline{CS1}$ high, \overline{ADSP} is blocked to control signals.

Burst cycle can be initiated with either the address status processor(ADSP) or address status cache controller(ADSC) inputs. Subsequent burst addresses are generated internally in the system's burst sequence and are controlled by the burst address advance(\overline{ADV}) input.

\overline{LBO} pin is DC operated and determines burst sequence(linear or interleaved).

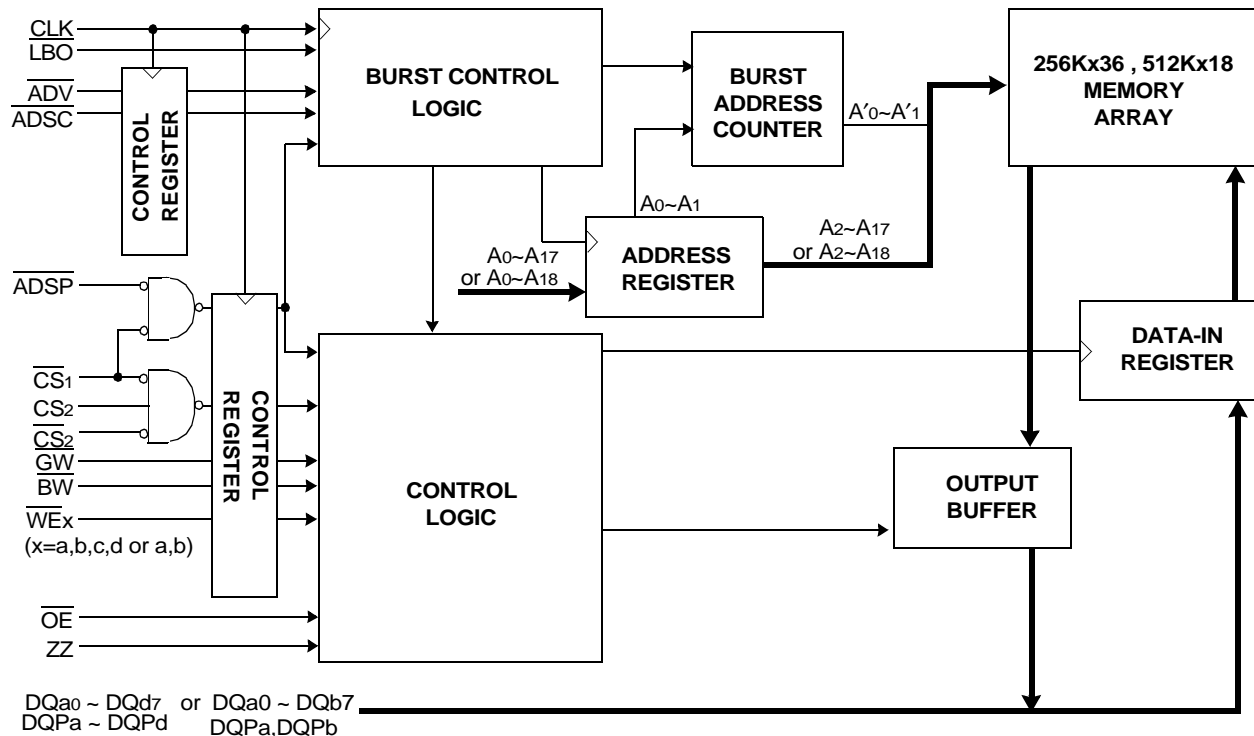

ZZ pin controls Power Down State and reduces Stand-by current regardless of CLK.

The KM736V887 and KM718V987 are fabricated using SAMSUNG's high performance CMOS technology and is available in a 100pin TQFP and 119BGA package. Multiple power and ground pins are utilized to minimize ground bounce.

FUNCTION DESCRIPTION

The KM736V887 and KM718V987 are synchronous SRAM designed to support the burst address accessing sequence of the Power PC based microprocessor. All inputs (with the exception of \overline{OE} , \overline{LBO} and \overline{ZZ}) are sampled on rising clock edges. The start and duration of the burst access is controlled by \overline{ADSC} , \overline{ADSP} and \overline{ADV} and chip select pins.

The accesses are enabled with the chip select signals and output enabled signals. Wait states are inserted into the access with \overline{ADV} .

When \overline{ZZ} is pulled high, the SRAM will enter a Power Down State. At this time, internal state of the SRAM is preserved. When \overline{ZZ} returns to low, the SRAM normally operates after 2cycles of wake up time. \overline{ZZ} pin is pulled down internally.

Read cycles are initiated with \overline{ADSP} (or \overline{ADSC}) using the new external address clocked into the on-chip address register when both \overline{GW} and \overline{BW} are high or when \overline{BW} is low and \overline{WEa} , \overline{WEb} , \overline{WEc} , and \overline{WEd} are high. When \overline{ADSP} is sampled low, the chip selects are sampled active, and the output buffer is enabled with \overline{OE} . the data of cell array accessed by the current address are projected to the output pins.

Write cycles are also initiated with \overline{ADSP} (or \overline{ADSC}) and are differentiated into two kinds of operations; All byte write operation and individual byte write operation.

All byte write occurs by enabling \overline{GW} (independent of \overline{BW} and \overline{WEx} .), and individual byte write is performed only when \overline{GW} is high and \overline{BW} is low. In KM736V887, a 256Kx36 organization, \overline{WEa} controls DQa0 ~ DQa7 and DQPa, \overline{WEb} controls DQb0 ~ DQb7 and DQPb, \overline{WEc} controls DQc0 ~ DQc7 and DQPc and \overline{WEd} controls DQd0 ~ DQd7 and DQPd.

$\overline{CS1}$ is used to enable the device and conditions internal use of \overline{ADSP} and is sampled only when a new external address is loaded.

\overline{ADV} is ignored at the clock edge when \overline{ADSP} is asserted, but can be sampled on the subsequent clock edges. The address increases internally for the next access of the burst when \overline{ADV} is sampled low.

Addresses are generated for the burst access as shown below, The starting point of the burst sequence is provided by the external address. The burst address counter wraps around to its initial state upon completion. The burst sequence is determined by the state of the \overline{LBO} pin. When this pin is Low, linear burst sequence is selected. And this pin is High, Interleaved burst sequence is selected.

BURST SEQUENCE TABLE

- Notes :** 1. X means "Don't Care". 2. The rising edge of clock is symbolized by ↑.
 3. $\overline{WRITE} = L$ means Write operation in WRITE TRUTH TABLE.
 $\overline{WRITE} = H$ means Read operation in WRITE TRUTH TABLE.
 4. Operation finally depends on status of asynchronous input pins(ZZ and \overline{OE}).

Notes

1. X means "Don't Care".
2. ZZ pin is pulled down internally
3. For write cycles that following read cycles, the output buffers must be disabled with OE, otherwise data bus contention will occur.
4. Sleep Mode means power down state of which stand-by current does not depend on cycle time.
5. Deselected means power down state of which stand-by current depends on cycle time.

Notes : 1. All address inputs must meet the specified setup and hold times for all rising clock edges whenever ADSC and/or ADSP is sampled low and CS is sampled low. All other synchronous inputs must meet the specified setup and hold times whenever this device is chip selected.
2. Both chip selects must be active whenever ADSC or ADSP is sampled low in order for the this device to remain enabled.
3. ADSC or ADSP must not be asserted for at least 2 Clock after leaving ZZ state.

APPLICATION INFORMATION

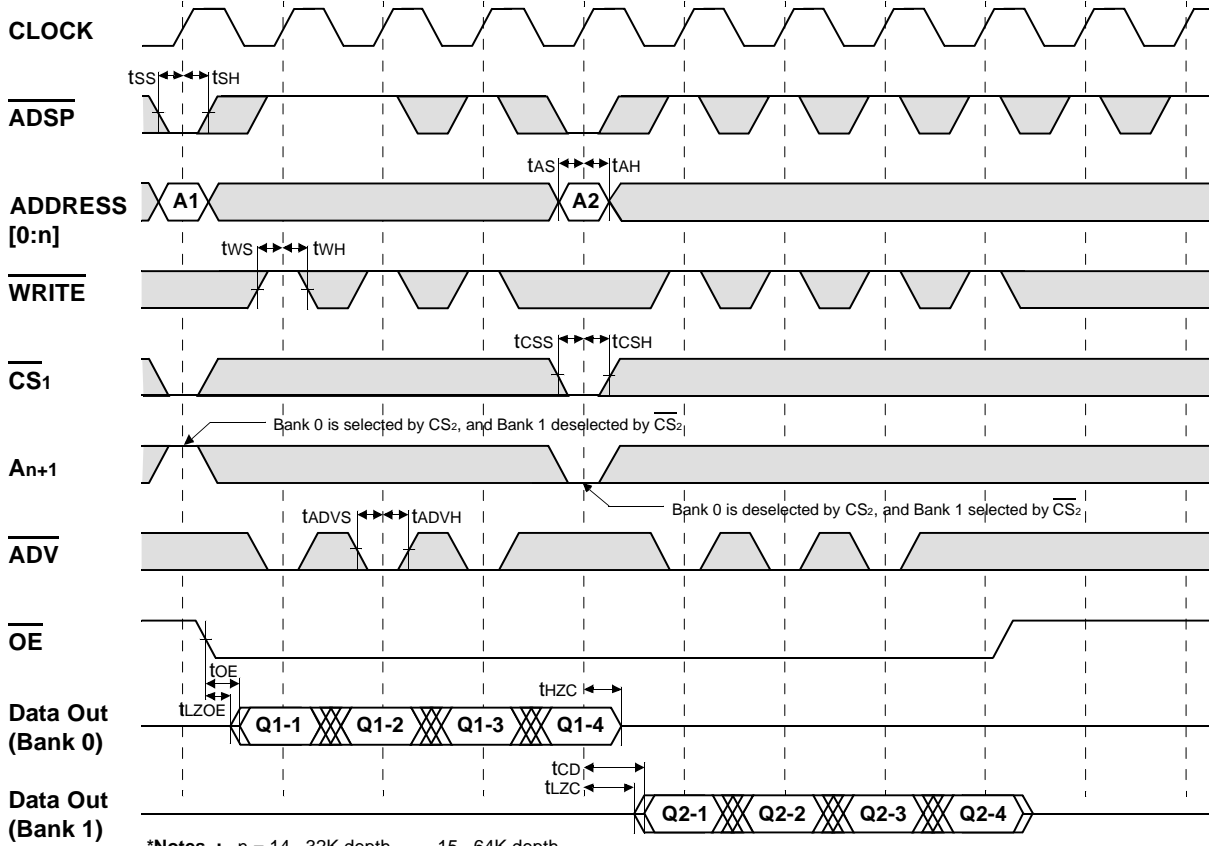

DEPTH EXPANSION

The Samsung 256Kx36 Synchronous Burst SRAM has two additional chip selects for simple depth expansion. This permits easy secondary cache upgrades from 256K depth to 512K depth without extra logic.

INTERLEAVE READ TIMING (Refer to non-interleave write timing for interleave write timing)

(ADSP CONTROLLED , ADSC=HIGH)

*Notes : n = 14 32K depth , 15 64K depth
16 128K depth , 17 256K depth
