

18M-BIT DDRII SRAM
4-WORD BURST OPERATION**Description**

The μ PD44164084 is a 2,097,152-word by 8-bit, the μ PD44164184 is a 1,048,576-word by 18-bit and the μ PD44164364 is a 524,288-word by 36-bit synchronous double data rate static RAM fabricated with advanced CMOS technology using full CMOS six-transistor memory cell.

The μ PD44164084, μ PD44164184 and μ PD44164364 integrate unique synchronous peripheral circuitry and a burst counter. All input registers controlled by an input clock pair (K and /K) are latched on the positive edge of K and /K. These products are suitable for application which require synchronous operation, high speed, low voltage, high density and wide bit configuration.

These products are packaged in 165-pin PLASTIC BGA.

Features

- 1.8 ± 0.1 V power supply and HSTL I/O
- DLL circuitry for wide output data valid window and future frequency scaling
- Pipelined double data rate operation
- Common data input/output bus
- Four-tick burst for reduced address frequency
- Two input clocks (K and /K) for precise DDR timing at clock rising edges only
- Two output clocks (C and /C) for precise flight time
and clock skew matching-clock and data delivered together to receiving device
- Internally self-timed write control
- Clock-stop capability with μ s restart
- User programmable impedance output
- Fast clock cycle time : 4.0 ns (250 MHz), 5.0 ns (200 MHz), 6.0 ns (167 MHz)
- Simple control logic for easy depth expansion
- JTAG boundary scan

**The information in this document is subject to change without notice. Before using this document, please confirm that this is the latest version.
Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.**

Pin Identification

Symbol	Description
A0 A1 A	Synchronous Address Inputs: These inputs are registered and must meet the setup and hold times around the rising edge of K. Balls 3A, 10A, and 2A are reserved for the next higher-order address inputs on future devices. All transactions operate on a burst of four words (two clock periods of bus activity). A0 and A1 are used as the lowest two address bits for BURST READ and BURST WRITE operations permitting a random burst start address on x18 and x36 devices. These inputs are ignored when device is deselected or once BURST operation is in progress.
DQ0 to DQxx	Synchronous Data IOs: Input data must meet setup and hold times around the rising edges of K and /K. Output data is synchronized to the respective C and /C data clocks or to K and /K if C and /C are tied to HIGH. x8 device uses DQ0 to DQ7. x18 device uses DQ0 to DQ17. x36 device uses DQ0 to DQ35.
/LD	Synchronous Load: This input is brought LOW when a bus cycle sequence is to be defined. This definition includes address and read/write direction. All transactions operate on a burst of 4 data (two clock periods of bus activity).
R, /W	Synchronous Read/Write Input: When /LD is LOW, this input designates the access type (READ when R, /W is HIGH, WRITE when R, /W is LOW) for the loaded address. R, /W must meet the setup and hold times around the rising edge of K.
/BWx /NWx	Synchronous Byte Writes (Nibble Writes on x8): When LOW these inputs cause their respective byte or nibble to be registered and written during WRITE cycles. These signals must meet setup and hold times around the rising edges of K and /K for each of the two rising edges comprising the WRITE cycle. See Pin Configurations for signal to data relationships.
K, /K	Input Clock: This input clock pair registers address and control inputs on the rising edge of K, and registers data on the rising edge of K and the rising edge of /K. /K is ideally 180 degrees out of phase with K. All synchronous inputs must meet setup and hold times around the clock rising edges.
C, /C	Output Clock: This clock pair provides a user controlled means of tuning device output data. The rising edge of /C is used as the output timing reference for first and third output data. The rising edge of C is used as the output reference for second and fourth output data. Ideally, /C is 180 degrees out of phase with C. C and /C may be tied HIGH to force the use of K and /K as the output reference clocks instead of having to provide C and /C clocks. If tied HIGH, C and /C must remain HIGH and not be toggled during device operation.
CQ, /CQ	Synchronous Echo Clock Outputs. The rising edges of these outputs are tightly matched to the synchronous data outputs and can be used as a data valid indication. These signals run freely and do not stop when DQ tristates.
<R> ZQ	Output Impedance Matching Input: This input is used to tune the device outputs to the system data bus impedance. DQ, CQ and /CQ output impedance are set to $0.2 \times RQ$, where RQ is a resistor from this bump to ground. This pin cannot be connected directly to GND or left unconnected. Also, in this product, there is no function to minimize the output impedance by connecting ZQ directly to V _{DDQ} . The output impedance is adjusted every 1,024 cycles upon power-up to account for drifts in supply voltage and temperature. After replacement for a resistor, the new output impedance is reset by implementing power-on and DLL lock time (TKC lock) again.
<R> /DLL	DLL Disable: When LOW, this input causes the DLL to be bypassed for stable low frequency operation. The AC/DC characteristics cannot be guaranteed. For normal operation, /DLL must be HIGH.
TMS TDI	IEEE 1149.1 Test Inputs: 1.8V I/O levels. These balls may be left Not Connected if the JTAG function is not used in the circuit.
TCK	IEEE 1149.1 Clock Input: 1.8V I/O levels. This pin must be tied to V _{SS} if the JTAG function is not used in the circuit.
TDO	IEEE 1149.1 Test Output: 1.8V I/O level.
VREF	HSTL Input Reference Voltage: Nominally V _{DDQ} /2. Provides a reference voltage for the input buffers.
VDD	Power Supply: 1.8V nominal. See Recommended DC Operating Conditions and DC Characteristics for range.
VDDQ	Power Supply: Isolated Output Buffer Supply. Nominally 1.5V. 1.8V is also permissible. See Recommended DC Operating Conditions and DC Characteristics for range.
VSS	Power Supply: Ground
<R> NC	No Connect: These signals are internally connected and appear in the JTAG scan chain as the logic level applied to the ball sites.

Block Diagram

Burst Sequence

Linear Burst Sequence Table

[μPD44164184, μPD44164364]

	A1, A0	A1, A0	A1, A0	A1, A0
External Address	0, 0	0, 1	1, 0	1, 1
1st Internal Burst Address	0, 1	1, 0	1, 1	0, 0
2nd Internal Burst Address	1, 0	1, 1	0, 0	0, 1
3rd Internal Burst Address	1, 1	0, 0	0, 1	1, 0

Truth Table

Operation	/LD	R, /W	CLK	DQ				
WRITE cycle Load address, input write data on two consecutive K and /K rising edge	L	L	L → H	Data in				
				Input data	D(A1)	D(A2)	D(A3)	D(A4)
				Input clock	K(t+1) ↑	/K(t+1) ↑	K(t+2) ↑	/K(t+2) ↑
READ cycle Load address, read data on two consecutive C and /C rising edge	L	H	L → H	Data out				
				Output data	Q(A1)	Q(A2)	Q(A3)	Q(A4)
				Output clock	/C(t+1) ↑	C(t+2) ↑	/C(t+2) ↑	C(t+3) ↑
NOP (No operation)	H	X	L → H	High-Z				
STANDBY(Clock stopped)	X	X	Stopped	Previous state				

Remarks 1. H : High level, L : Low level, x : don't care, ↑ : rising edge.

2. Data inputs are registered at K and /K rising edges. Data outputs are delivered at C and /C rising edges except if C and /C are HIGH then Data outputs are delivered at K and /K rising edges.
3. All control inputs in the truth table must meet setup/hold times around the rising edge (LOW to HIGH) of K. All control inputs are registered during the rising edge of K.
4. This device contains circuitry that will ensure the outputs will be in high impedance during power-up.
5. Refer to state diagram and timing diagrams for clarification.
6. A1 refers to the address input during a WRITE or READ cycle. A2, A3 and A4 refer to the next internal burst address in accordance with the linear burst sequence.
7. It is recommended that K = /K = C = /C when clock is stopped. This is not essential but permits most rapid restart by overcoming transmission line charging symmetrically.

Byte Write Operation

[μPD44164084]

Operation	K	/K	/NW0	/NW1
Write DQ0 to DQ7	L → H	–	0	0
	–	L → H	0	0
Write DQ0 to DQ3	L → H	–	0	1
	–	L → H	0	1
Write DQ4 to DQ7	L → H	–	1	0
	–	L → H	1	0
Write nothing	L → H	–	1	1
	–	L → H	1	1

Remark H : High level, L : Low level, → : rising edge.

[μPD44164184]

Operation	K	/K	/BW0	/BW1
Write DQ0 to DQ17	L → H	–	0	0
	–	L → H	0	0
Write DQ0 to DQ8	L → H	–	0	1
	–	L → H	0	1
Write DQ9 to DQ17	L → H	–	1	0
	–	L → H	1	0
Write nothing	L → H	–	1	1
	–	L → H	1	1

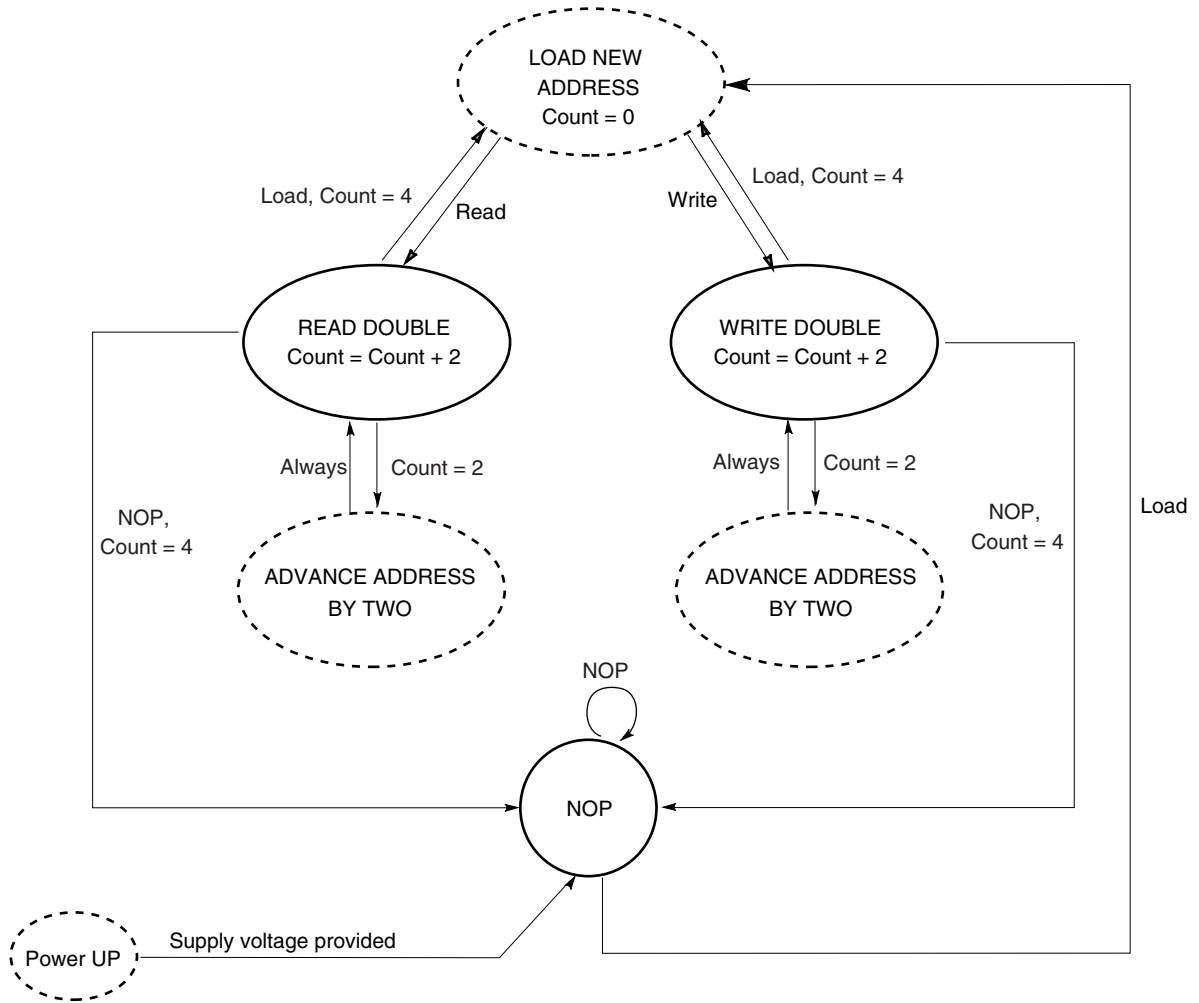

Remark H : High level, L : Low level, → : rising edge.

[μPD44164364]

Operation	K	/K	/BW0	/BW1	/BW2	/BW3
Write DQ0 to DQ35	L → H	–	0	0	0	0
	–	L → H	0	0	0	0
Write DQ0 to DQ8	L → H	–	0	1	1	1
	–	L → H	0	1	1	1
Write DQ9 to DQ17	L → H	–	1	0	1	1
	–	L → H	1	0	1	1
Write DQ18 to DQ26	L → H	–	1	1	0	1
	–	L → H	1	1	0	1
Write DQ27 to DQ35	L → H	–	1	1	1	0
	–	L → H	1	1	1	0
Write nothing	L → H	–	1	1	1	1
	–	L → H	1	1	1	1

Remark H : High level, L : Low level, → : rising edge.

Bus Cycle State Diagram

- Remarks**
1. A0 and A1 are internally advanced in accordance with the burst order table.
Bus cycle is terminated after burst count = 4.
 2. State transitions: L = (/LD = LOW); /L = (/LD = HIGH); R = (/R, W = HIGH); W = (/R, W = LOW).
 3. State machine control timing sequence is controlled by K.

Electrical Specifications

Absolute Maximum Ratings

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit
Supply voltage	V _{DD}		-0.5		+2.9	V
Output supply voltage	V _{DDQ}		-0.5		V _{DD}	V
Input voltage	V _{IN}		-0.5		V _{DD} + 0.5 (2.9 V MAX.)	V
Input / Output voltage	V _{I/O}		-0.5		V _{DDQ} + 0.5 (2.9 V MAX.)	V
Operating ambient temperature	T _A		0		70	°C
Storage temperature	T _{stg}		-55		+125	°C

Caution Exposing the device to stress above those listed in Absolute Maximum Ratings could cause permanent damage. The device is not meant to be operated under conditions outside the limits described in the operational section of this specification. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

Recommended DC Operating Conditions (T_A = 0 to 70 °C)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit	Note
Supply voltage	V _{DD}		1.7		1.9	V	
Output supply voltage	V _{DDQ}		1.4		V _{DD}	V	1
High level input voltage	V _{IH} (DC)		V _{REF} + 0.1		V _{DDQ} + 0.3	V	1, 2
Low level input voltage	V _{IL} (DC)		-0.3		V _{REF} - 0.1	V	1, 2
Clock input voltage	V _{IN}		-0.3		V _{DDQ} + 0.3	V	1, 2
Reference voltage	V _{REF}		0.68		0.95	V	3

- Notes**
1. During normal operation, V_{DDQ} must not exceed V_{DD}.
 2. Power-up: V_{IH} ≤ V_{DDQ} + 0.3 V and V_{DD} ≤ 1.7 V and V_{DDQ} ≤ 1.4 V for t ≤ 200 ms
 3. Between the Power-On and Power-Off, V_{REF} must not exceed V_{DD}.

<R>

Recommended AC Operating Conditions (T_A = 0 to 70 °C)

Parameter	Symbol	Conditions	MIN.	TYP.	MAX.	Unit	Note
High level input voltage	V _{IH} (AC)		V _{REF} + 0.2		-	V	1
Low level input voltage	V _{IL} (AC)		-		V _{REF} - 0.2	V	1

- Note 1.** Overshoot: V_{IH} (AC) ≤ V_{DD} + 0.7 V for t ≤ TKHKH/2
 Undershoot: V_{IL} (AC) ≥ -0.5 V for t ≤ TKHKH/2
 Control input signals may not have pulse widths less than TKHKL (MIN.) or operate at cycle rates less than TKHKH (MIN.).

DC Characteristics (T_A = 0 to 70°C, V_{DD} = 1.8 ± 0.1 V)

Parameter	Symbol	Test condition	MIN.	TYP.	MAX.		Unit	Note
					x8, x18	x36		
Input leakage current	I _{LI}		-2	-	+2		μA	
I/O leakage current	I _{LO}		-2	-	+2		μA	
Operating supply current (Read Write cycle)	I _{DD}	V _{IN} ≤ V _{IL} or V _{IN} ≥ V _{IH} , I _{I/O} = 0 mA Cycle = MAX.	-E40		620	-	mA	
			-E50		540	620		
			-E60		470	570		
Standby supply current (NOP)	I _{SB1}	V _{IN} ≤ V _{IL} or V _{IN} ≥ V _{IH} , I _{I/O} = 0 mA Cycle = MAX.	-E40		320	-	mA	
			-E50		270			
			-E60		250			
High level output voltage	V _{OH(Low)}	I _{OH} ≤ 0.1 mA	V _{DDQ} - 0.2	-	V _{DDQ}		V	3, 4
	V _{OH}	Note1	V _{DDQ} /2 - 0.12	-	V _{DDQ} /2 + 0.12		V	3, 4
Low level output voltage	V _{OL(Low)}	I _{OL} ≤ 0.1 mA	V _{SS}	-	0.2		V	3, 4
	V _{OL}	Note2	V _{DDQ} /2 - 0.12	-	V _{DDQ} /2 + 0.12		V	3, 4

- Notes**
1. Outputs are impedance-controlled. |I_{OH}| = (V_{DDQ}/2)/(R_Q/5) for values of 175 Ω ≤ R_Q ≤ 350 Ω.
 2. Outputs are impedance-controlled. I_{OL} = (V_{DDQ}/2)/(R_Q/5) for values of 175 Ω ≤ R_Q ≤ 350 Ω.
 3. AC load current is higher than the shown DC values.
 4. HSTL outputs meet JEDEC HSTL Class I standards.

<R>

Capacitance (T_A = 25 °C, f = 1MHz)

Parameter	Symbol	Test conditions	MIN.	TYP.	MAX.	Unit
Input capacitance	C _{IN}	V _{IN} = 0 V		4	5	pF
Input / Output capacitance	C _{I/O}	V _{I/O} = 0 V		6	7	pF
Clock Input capacitance	C _{clk}	V _{clk} = 0 V		5	6	pF

Remark These parameters are periodically sampled and not 100% tested.

AC Characteristics ($T_A = 0$ to 70 °C, $V_{DD} = 1.8 \pm 0.1$ V)

C HIGH to output Low-Z	TCHQX1	–0.45	–	–0.45	–	–0.5	–	ns		
Setup Times										
Address valid to K rising edge	TAVKH	0.5	–	0.6	–	0.7	–	ns	5	
Synchronous load input (/LD), read write input (R, /W) valid to K rising edge	TIVKH	0.5	–	0.6	–	0.7	–	ns	5	
Data inputs and write data select inputs (/BWx, /NWx) valid to K, /K rising edge	TDVKH	0.35	–	0.4	–	0.5	–	ns	5	
Hold Times										
K rising edge to address hold	TKHAX	0.5	–	0.6	–	0.7	–	ns	5	
K rising edge to synchronous load input (/LD), read write input (R, /W) hold	TKHIX	0.5	–	0.6	–	0.7	–	ns	5	
K, /K rising edge to data inputs and write data select inputs (/BWx, /NWx) hold	TKHDX	0.35	–	0.4	–	0.5	–	ns	5	

- <R> **Notes**
1. The device can operate at a clock frequency slower than TKHKH (MAX.) without the DLL circuit being used, if /DLL = low level. The AC/DC characteristics cannot be guaranteed, however.
 2. Clock phase jitter is the variance from clock rising edge to the next expected clock rising edge.
 3. V_{DD} slew rate must be less than 0.1 V DC per 50 ns for DLL lock retention.
DLL lock time begins once V_{DD} and input clock are stable.
It is recommended that the device is kept inactive during these cycles.
 4. Echo clock is very tightly controlled to data valid / data hold. By design, there is a ± 0.1 ns variation from echo clock to data. The data sheet parameters reflect tester guardbands and test setup variations.
 5. This is a synchronous device. All addresses, data and control lines must meet the specified setup and hold times for all latching clock edges.

- Remarks**
1. This parameter is sampled.
 2. Test conditions as specified with the output loading as shown in AC Test Conditions unless otherwise noted.
 3. Control input signals may not be operated with pulse widths less than TKHKL (MIN.).
 4. If C, /C are tied HIGH, K, /K become the references for C, /C timing parameters.
 5. V_{DDQ} is 1.5 V DC.

Read and Write Timing

- Remarks**
1. Q01 refers to output from address A0.
Q02 refers to output from the next internal burst address following A0, etc.
 2. Outputs are disable (high impedance) one clock cycle after a NOP.
 3. The second NOP cycle is not necessary for correct device operation;
however, at high clock frequencies it may be required to prevent bus contention.

JTAG Specification

These products support a limited set of JTAG functions as in IEEE standard 1149.1.

Test Access Port (TAP) Pins

Pin name	Pin assignments	Description
TCK	2R	Test Clock Input. All input are captured on the rising edge of TCK and all outputs propagate from the falling edge of TCK.
TMS	10R	Test Mode Select. This is the command input for the TAP controller state machine.
TDI	11R	Test Data Input. This is the input side of the serial registers placed between TDI and TDO. The register placed between TDI and TDO is determined by the state of the TAP controller state machine and the instruction that is currently loaded in the TAP instruction.
TDO	1R	Test Data Output. Output changes in response to the falling edge of TCK. This is the output side of the serial registers placed between TDI and TDO.

Remark The device does not have TRST (TAP reset). The Test-Logic Reset state is entered while TMS is held high for five rising edges of TCK. The TAP controller state is also reset on the SRAM POWER-UP.

JTAG DC Characteristics (T_A = 0 to 70°C, V_{DD} = 1.8 ± 0.1 V, unless otherwise noted)

JTAG Timing Diagram

Scan Register Definition (1)

Register name	Description
Instruction register	The instruction register holds the instructions that are executed by the TAP controller when it is moved into the run-test/idle or the various data register state. The register can be loaded when it is placed between the TDI and TDO pins. The instruction register is automatically preloaded with the IDCODE instruction at power-up whenever the controller is placed in test-logic-reset state.
Bypass register	The bypass register is a single bit register that can be placed between TDI and TDO. It allows serial test data to be passed through the RAMs TAP to another device in the scan chain with as little delay as possible.
ID register	The ID Register is a 32 bit register that is loaded with a device and vendor specific 32 bit code when the controller is put in capture-DR state with the IDCODE command loaded in the instruction register. The register is then placed between the TDI and TDO pins when the controller is moved into shift-DR state.
Boundary register	The boundary register, under the control of the TAP controller, is loaded with the contents of the RAMs I/O ring when the controller is in capture-DR state and then is placed between the TDI and TDO pins when the controller is moved to shift-DR state. Several TAP instructions can be used to activate the boundary register. The Scan Exit Order tables describe which device bump connects to each boundary register location. The first column defines the bit's position in the boundary register. The second column is the name of the input or I/O at the bump and the third column is the bump number.

Scan Register Definition (2)

JTAG Instructions

Instructions	Description
EXTEST	The EXTEST instruction allows circuitry external to the component package to be tested. Boundary-scan register cells at output pins are used to apply test vectors, while those at input pins capture test results. Typically, the first test vector to be applied using the EXTEST instruction will be shifted into the boundary scan register using the PRELOAD instruction. Thus, during the update-IR state of EXTEST, the output driver is turned on and the PRELOAD data is driven onto the output pins.
IDCODE	The IDCODE instruction causes the ID ROM to be loaded into the ID register when the controller is in capture-DR mode and places the ID register between the TDI and TDO pins in shift-DR mode. The IDCODE instruction is the default instruction loaded in at power up and any time the controller is placed in the test-logic-reset state.
BYPASS	The BYPASS instruction is loaded in the instruction register when the bypass register is placed between TDI and TDO. This occurs when the TAP controller is moved to the shift-DR state. This allows the board level scan path to be shortened to facilitate testing of other devices in the scan path.
SAMPLE / PRELOAD	SAMPLE / PRELOAD is a Standard 1149.1 mandatory public instruction. When the SAMPLE / PRELOAD instruction is loaded in the instruction register, moving the TAP controller into the capture-DR state loads the data in the RAMs input and DQ pins into the boundary scan register. Because the RAM clock(s) are independent from the TAP clock (TCK) it is possible for the TAP to attempt to capture the I/O ring contents while the input buffers are in transition (i.e., in a metastable state). Although allowing the TAP to sample metastable input will not harm the device, repeatable results cannot be expected. RAM input signals must be stabilized for long enough to meet the TAPs input data capture setup plus hold time (t_{CS} plus t_{CH}). The RAMs clock inputs need not be paused for any other TAP operation except capturing the I/O ring contents into the boundary scan register. Moving the controller to shift-DR state then places the boundary scan register between the TDI and TDO pins.
SAMPLE-Z	If the SAMPLE-Z instruction is loaded in the instruction register, all RAM DQ pins are forced to an inactive drive state (high impedance) and the boundary register is connected between TDI and TDO when the TAP controller is moved to the shift-DR state.

JTAG Instruction Coding

IR2	IR1	IR0	Instruction	Note
0	0	0	EXTEST	
0	0	1	IDCODE	
0	1	0	SAMPLE-Z	1
0	1	1	RESERVED	2
1	0	0	SAMPLE / PRELOAD	
1	0	1	RESERVED	2
1	1	0	RESERVED	2
1	1	1	BYPASS	

Note 1. TRISTATE all DQ pins and CAPTURE the pad values into a SERIAL SCAN LATCH.

<R> **2.** Do not use this instruction code because the vendor uses it to evaluate this product.

TAP Controller State Diagram

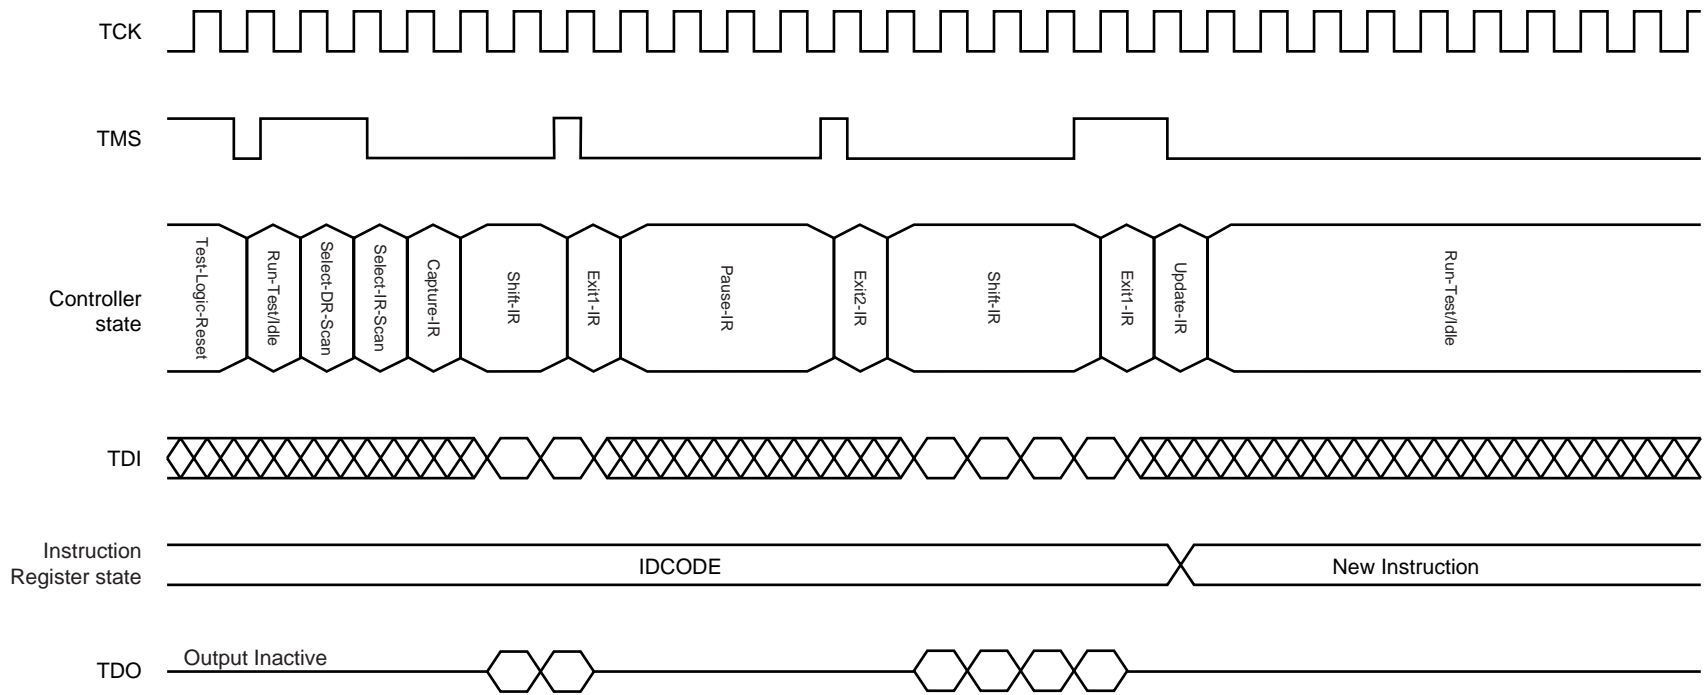

Disabling the Test Access Port

It is possible to use this device without utilizing the TAP. To disable the TAP Controller without interfering with normal operation of the device, TCK must be tied to Vss to preclude mid level inputs.

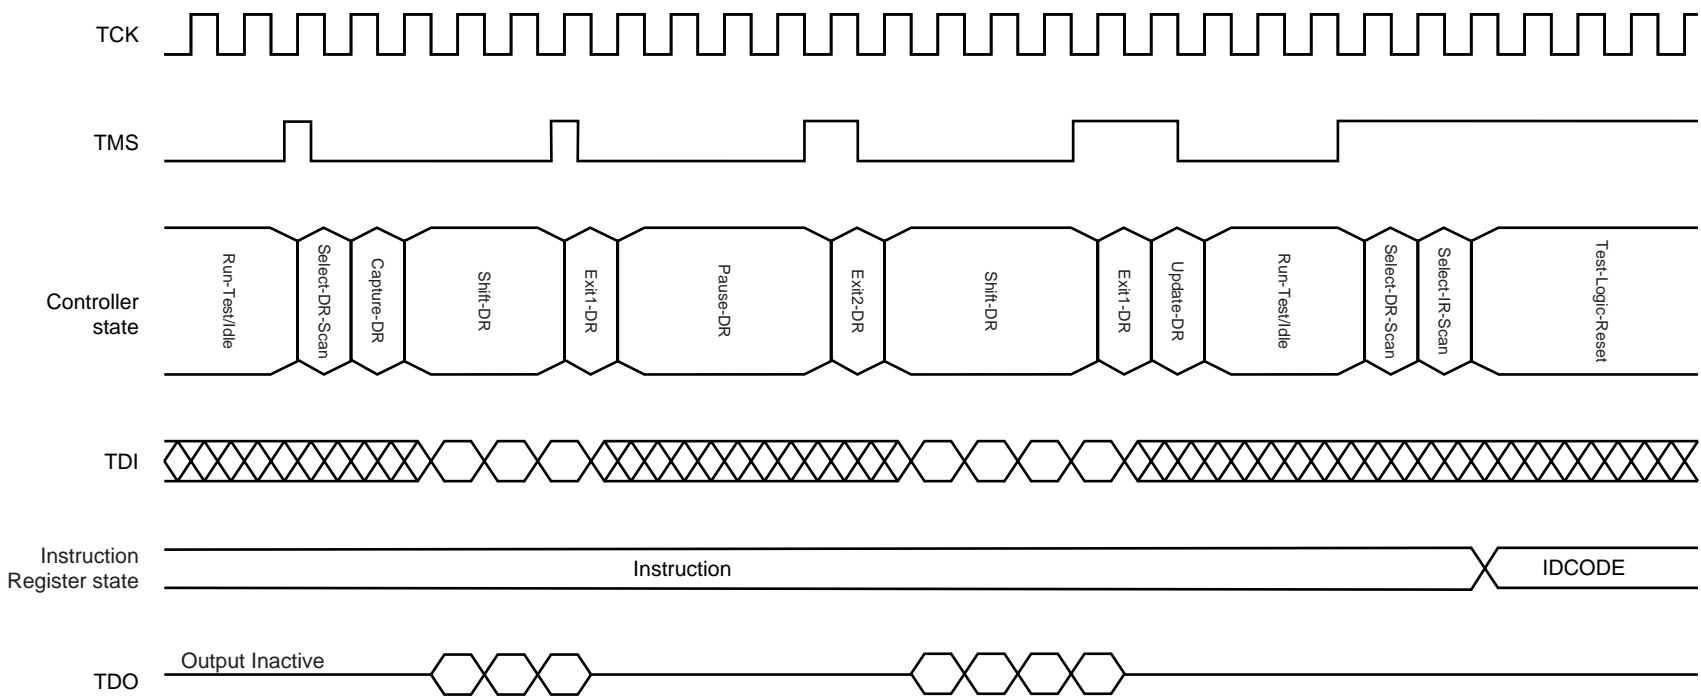

TDI and TMS are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected. But they may also be tied to VDD through a 1 kΩ resistor.

TDO should be left unconnected.

[MEMO]

[MEMO]

NOTES FOR CMOS DEVICES

① VOLTAGE APPLICATION WAVEFORM AT INPUT PIN

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (MAX) and V_{IH} (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (MAX) and V_{IH} (MIN).

② HANDLING OF UNUSED INPUT PINS

Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to V_{DD} or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

③ PRECAUTION AGAINST ESD

A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

④ STATUS BEFORE INITIALIZATION

Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

⑤ POWER ON/OFF SEQUENCE

In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current.

The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

⑥ INPUT OF SIGNAL DURING POWER OFF STATE

Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

- **The information in this document is current as of April, 2007. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets or data books, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.**
- No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.
- NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.
- Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.
- While NEC Electronics endeavors to enhance the quality, reliability and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC Electronics products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.
- NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".

The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.

"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.

"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).

"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.

(Note)

- (1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.
- (2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).
