EQUIVALENT SCHEMATIC

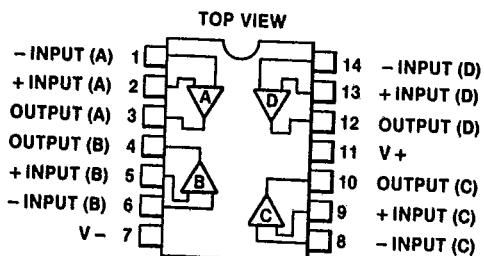

GENERAL DESCRIPTION

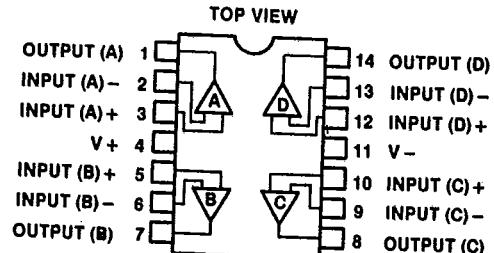

The MPOP09/MPOP11 is a quad matched amplifier set (741-type) in a single 14-pin DIP package. The MPOP11 is a plug-in replacement for the OP11, LM348, and LM148 amplifiers while the MPOP09 is a plug-in replacement for OP09, RC4136, and RM4136 amplifiers. Matched parameters include offset voltage and common mode rejection ratio – important considerations for instrumentation amplifiers. Also, for good audio system performance, the amplifiers have been designed to have equal positive and negative slew rates.

Incorporated into each of the amplifiers are the MPOP02 advantages of low drift and noise. Micro Power Systems' "Silicon Nitride Passivation" provides long-term stability, reduced "popcorn noise" and maximum reliability. For designs requiring minimum space and cost, the MPOP09 and MPOP11 amplifiers are ideal. The MPOP09 and MPOP11 are a good choice in circuits requiring MP5502-type performance in quad configuration.

MATCHING PARAMETER DEFINITIONS

Common Mode Rejection Ratio Match (ΔCMRR). The difference between the common-mode rejection ratios of side A and side B. ΔCMRR in dB = $-20 \log_{10}$. Match exists between any two amplifiers.

Input Offset Voltage Match (ΔV_{OS}). The difference between the offset voltages of side A and side B. ($V_{OSA} - V_{OSB}$). Using amplifier A as reference, then $\Delta V_{OS} = V_{OSN} - V_{OSA}$.

DEFINITIONS FOR MPOP09 & MPOP11

Input Offset Voltage (V_{OS}). The voltage required at either input to drive the output to zero volts in a closed loop condition.

Input Noise Voltage ($\text{en}_p - p$). The peak-to-peak noise voltage for a defined bandwidth.

Input Bias Current (I_B). The average current needed at both input terminals to obtain zero volts at the output.

Common Mode Rejection Ratio (CMRR). The ratio of the common mode voltage at the inputs to the resulting voltage error at the output.
