### DESCRIPTION

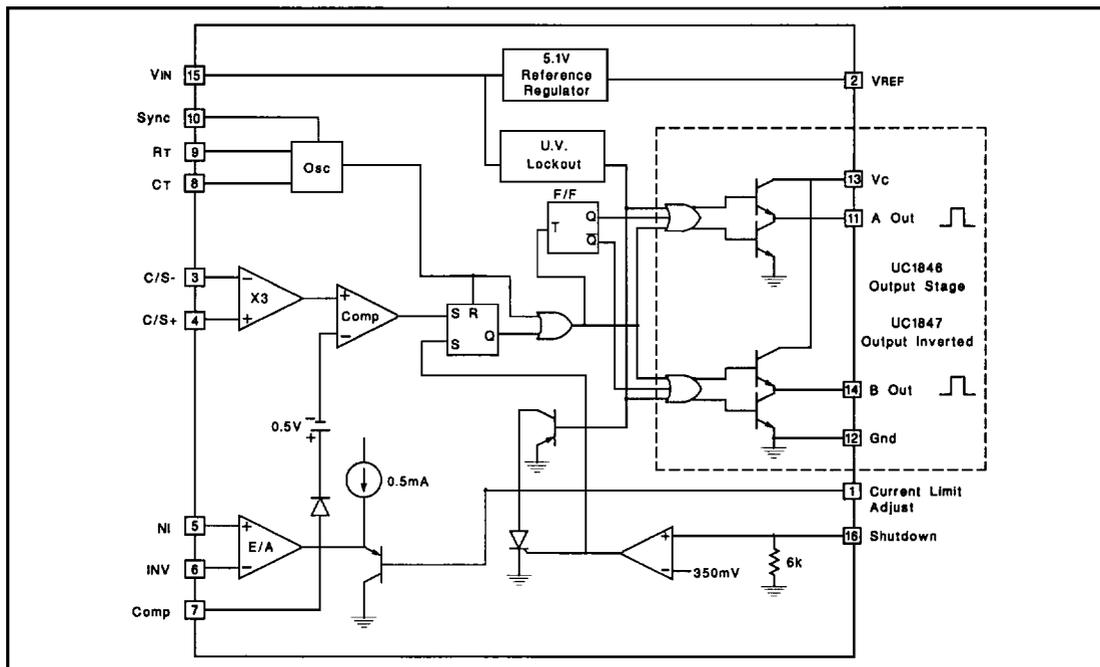

The UC1846/7 family of control ICs provides all of the necessary features to implement fixed frequency, current mode control schemes while maintaining a minimum external parts count. The superior performance of this technique can be measured in improved line regulation, enhanced load response characteristics, and a simpler, easier-to-design control loop. Topological advantages include inherent pulse-by-pulse current limiting capability, automatic symmetry correction for push-pull converters, and the ability to parallel "power modules" while maintaining equal current sharing.

Protection circuitry includes built-in under-voltage lockout and programmable current limit in addition to soft start capability. A shutdown function is also available which can initiate either a complete shutdown with automatic restart or latch the supply off.

Other features include fully latched operation, double pulse suppression, deadline adjust capability, and a  $\pm 1\%$  trimmed bandgap reference.

The UC1846 features low outputs in the OFF state, while the UC1847 features high outputs in the OFF state.

**APPLICATIONS DATA**

**Oscillator Circuit**

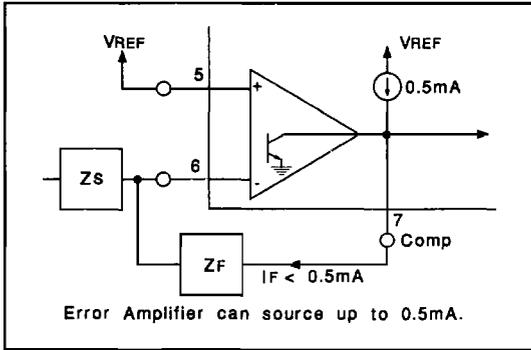

Output deadtime is determined by the external capacitor, CT, according to the formula:  $\tau_d (\mu s) = 145CT (\mu f) \left( \frac{12}{12 - \frac{3.6}{RT (k\Omega)}} \right)$ .

For large values of RT:  $\tau_d (\mu s) \approx 145CT (\mu f)$ .

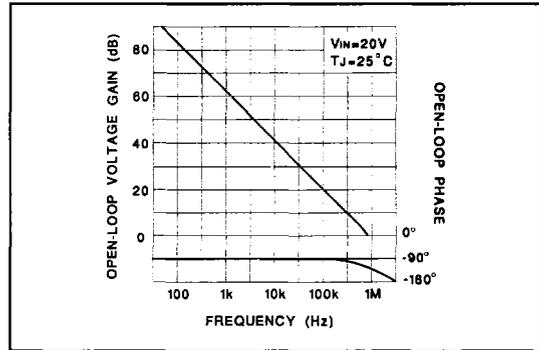

Oscillator frequency is approximated by the formula:  $f_r (kHz) \approx \frac{2.2}{RT (k\Omega) \cdot CT (\mu f)}$ .
