DESCRIPTION

The QSFCT573T and QSFCT2573T are 8-bit high-speed CMOS TTL-compatible buffered latches with three-state outputs that are ideal for driving high capacitance loads such as memory and address buses. The 2573 devices are 25Ω resistor output versions useful for driving transmission lines and reducing system noise. The 2573 series parts can replace the 573 series to reduce noise in an existing design. All inputs have clamp diodes for undershoot noise suppression. All outputs have ground bounce suppression (see QSI Application Note AN-001), and outputs will not load an active bus when Vcc is removed from the device.

Notes:
1. Typical values indicate V_{CC}=5.0V and T_A=25°C.
2. Not more than one output should be shorted and the duration is ≤1 second.
3. These parameters are guaranteed by design but not tested.

POWER SUPPLY CHARACTERISTICS

Symbol	Parameter	Test Conditions (1)	Min	Max	Unit
Icc	Quiescent Power Supply Current	Vcc = MAX, freq = 0 0V≤Vin≤0.2V or Vcc-0.2V≤Vin≤Vcc	-	1.5	mA
ΔIcc	Supply Current per Input @ TTL HIGH	Vcc = MAX, Vin =3.4 V, freq = 0 (2)	-	2.0	
Qccd	Supply Current per input per mHz	Vcc = MAX, Outputs open and enabled One bit toggling @ 50% duty cycle Other inputs at GND or Vcc (3,4)	-	0.25	mA/ MHz

1. For conditions shown as MIN or MAX use the appropriate values specified under DC specifications.
2. Per TTL driven input (Vi=3.4V)
3. For flipflops Qccd is measured by switching one of the data in pins so that the output changes every clock cycle. This is a measurement of device power consumption only and does not include power to drive load capacitance or tester capacitance. This parameter is guaranteed by design but not tested.
4. Ic can be computed using the above parameters as explained in the Technical Overview section.
