8K x 8 nvSRAM
QuantumTrap™ CMOS
## Nonvolatile Static RAM

SIMTEK

FEATURES

- **25ns, 35ns, 45ns and 55ns Access Times**
- ***STORE* to Nonvolatile Elements Initiated by Software**
- ***RECALL* to SRAM Initiated by Software or Power Restore**
- **10mA Typical I_{cc} at 200ns Cycle Time**
- **Unlimited READ, WRITE and *RECALL* Cycles**
- **1,000,000 *STORE* Cycles to Nonvolatile Elements (Industrial/Commercial)**
- **100-Year Data Retention (Industrial/Commercial)**
- **Commercial, Industrial and Military Temperatures**
- **28-Pin DIP, SOIC and LCC Packages**

DESCRIPTION

The Simtek STK11C68 is a fast static RAM with a nonvolatile element incorporated in each static memory cell. The SRAM can be read and written an unlimited number of times, while independent non-volatile data resides in the Nonvolatile Elements. Data transfers from the SRAM to the Nonvolatile Elements (the *STORE* operation), or from Nonvolatile Elements to SRAM (the *RECALL* operation), take place using a software sequence. Transfers from the Nonvolatile Elements to the SRAM (the *RECALL* operation) also take place automatically on restoration of power.

The STK11C68 is pin-compatible with industry-standard SRAMs. MIL-STD-883 device is also available (STK11C68-M).

BLOCK DIAGRAM
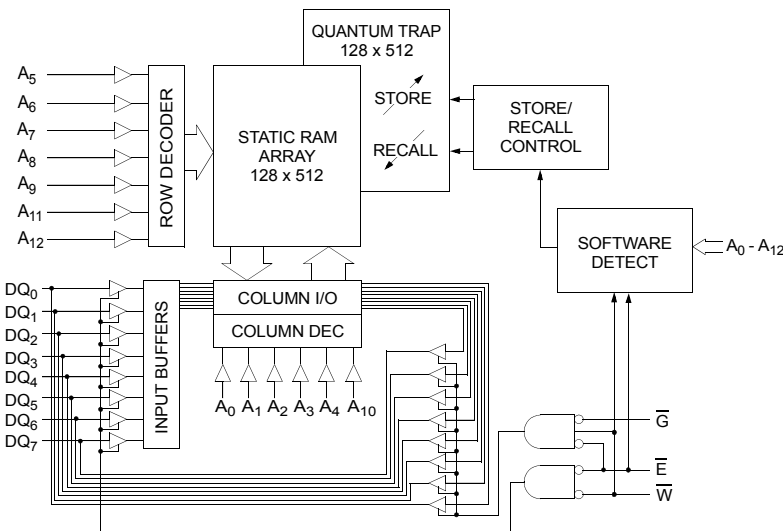

PIN CONFIGURATIONS

28 - LCC

28 - DIP
28 - SOIC
PIN NAMES

A_0 - A_{12}	Address Inputs
$\overline{W}$	Write Enable
DQ_0 - DQ_7	Data In/Out
$\overline{E}$	Chip Enable
$\overline{G}$	Output Enable
V_{CC}	Power (+ 5V)
V_{SS}	Ground

ABSOLUTE MAXIMUM RATINGS[a]

Voltage on Input Relative to Ground . . . .–0.5V to 7.0V
Voltage on Input Relative to V_{SS} . . . . –0.6V to (V_{CC} + 0.5V)
Voltage on DQ_{0-7} . . . . –0.5V to (V_{CC} + 0.5V)
Temperature under Bias . . . .–55°C to 125°C
Storage Temperature . . . .–65°C to 150°C
Power Dissipation 1W
DC Output Current (1 output at a time, 1s duration) 15mA

Note a: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only, and functional operation of the device at conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

DC CHARACTERISTICS   (V_{CC} = 5.0V ± 10%)

SYMBOL	PARAMETER	COMMERCIAL		INDUSTRIAL/ MILITARY		UNITS	NOTES
		MIN	MAX	MIN	MAX		
I_{CC_1}[b]	Average V_{CC} Current		90 75 65 N/A		90 75 65 55	mA mA mA mA	t_{AVAV} = 25ns t_{AVAV} = 35ns t_{AVAV} = 45ns t_{AVAV} = 55ns
I_{CC_2}[c]	Average V_{CC} Current during *STORE*		3		3	mA	All Inputs Don't Care, V_{CC} = max
I_{CC_3}[b]	Average V_{CC} Current at t_{AVAV} = 200ns 5V, 25°C, Typical		10		10	mA	$\overline{W} \geq (V_{CC} - 0.2V)$ All Others Cycling, CMOS Levels
I_{SB_1}[d]	Average V_{CC} Current (Standby, Cycling TTL Input Levels)		27 23 20 N/A		28 24 21 20	mA mA mA mA	t_{AVAV} = 25ns, $\overline{E} \geq V_{IH}$ t_{AVAV} = 35ns, $\overline{E} \geq V_{IH}$ t_{AVAV} = 45ns, $\overline{E} \geq V_{IH}$ t_{AVAV} = 55ns, $\overline{E} \geq V_{IH}$
I_{SB_2}[d]	V_{CC} Standby Current (Standby, Stable CMOS Input Levels)		750		1500	μA	$\overline{E} \geq (V_{CC} - 0.2V)$ All Others $V_{IN} \leq 0.2V$ or $\geq (V_{CC} - 0.2V)$
I_{ILK}	Input Leakage Current		±1		±1	μA	V_{CC} = max $V_{IN} = V_{SS}$ to V_{CC}
I_{OLK}	Off-State Output Leakage Current		±5		±5	μA	V_{CC} = max $V_{IN} = V_{SS}$ to V_{CC}, $\overline{E}$ or $\overline{G} \geq V_{IH}$
V_{IH}	Input Logic "1" Voltage	2.2	V_{CC} + .5	2.2	V_{CC} + .5	V	All Inputs
V_{IL}	Input Logic "0" Voltage	$V_{SS} - .5$	0.8	$V_{SS} - .5$	0.8	V	All Inputs
V_{OH}	Output Logic "1" Voltage	2.4		2.4		V	$I_{OUT} = -4mA$
V_{OL}	Output Logic "0" Voltage		0.4		0.4	V	$I_{OUT} = 8mA$
T_A	Operating Temperature	0	70	−40	85	°C	

Note b: I_{CC_1} and I_{CC_3} are dependent on output loading and cycle rate. The specified values are obtained with outputs unloaded.
Note c: I_{CC} is the average current required for the duration of the *STORE* cycle (t_{STORE}).
Note d: $\overline{E} \geq V_{IH}$ will not produce standby current levels until any nonvolatile cycle in progress has timed out.

AC TEST CONDITIONS

Note n: The six consecutive addresses must be in the order listed in the Software *STORE/RECALL* Mode Selection Table: (0000, 1555, 0AAA, 1FFF, 10F0, 0F0F) for a *STORE* cycle or (0000, 1555, 0AAA, 1FFF, 10F0, 0F0E) for a *RECALL* cycle. $\overline{W}$ must be high during all six consecutive cycles.

SOFTWARE *STORE/RECALL* CYCLE: $\overline{E}$ Controlled[n]
DEVICE OPERATION

The STK11C68 is a versatile memory chip that provides several modes of operation. The STK11C68 can operate as a standard 8K x 8 SRAM. It has an 8K x 8 Nonvolatile Elements shadow to which the SRAM information can be copied or from which the SRAM can be updated in nonvolatile mode.

NOISE CONSIDERATIONS

Note that the STK11C68 is a high-speed memory and so must have a high-frequency bypass capacitor of approximately 0.1µF connected between V_{cc} and V_{ss}, using leads and traces that are as short as possible. As with all high-speed CMOS ICs, normal careful routing of power, ground and signals will help prevent noise problems.

SRAM READ

The STK11C68 performs a READ cycle whenever $\overline{E}$ and $\overline{G}$ are low and $\overline{W}$ is high. The address specified on pins A_{0-12} determines which of the 8,192 data bytes will be accessed. When the READ is initiated by an address transition, the outputs will be valid after a delay of t_{AVQV} (READ cycle #1). If the READ is initiated by $\overline{E}$ or $\overline{G}$, the outputs will be valid at t_{ELQV} or at t_{GLQV}, whichever is later (READ cycle #2). The data outputs will repeatedly respond to address changes within the t_{AVQV} access time without the need for transitions on any control input pins, and will remain valid until another address change or until $\overline{E}$ or $\overline{G}$ is brought high.

SRAM WRITE

A WRITE cycle is performed whenever $\overline{E}$ and $\overline{W}$ are low. The address inputs must be stable prior to entering the WRITE cycle and must remain stable until either $\overline{E}$ or $\overline{W}$ goes high at the end of the cycle. The data on the common I/O pins DQ_{0-7} will be written into the memory if it is valid t_{DVWH} before the end of a $\overline{W}$ controlled WRITE or t_{DVEH} before the end of an $\overline{E}$ controlled WRITE.

It is recommended that $\overline{G}$ be kept high during the entire WRITE cycle to avoid data bus contention on the common I/O lines. If $\overline{G}$ is left low, internal circuitry will turn off the output buffers t_{WLQZ} after $\overline{W}$ goes low.

SOFTWARE NONVOLATILE *STORE*

The STK11C68 software *STORE* cycle is initiated by executing sequential READ cycles from six specific address locations. During the *STORE* cycle an erase of the previous nonvolatile data is first performed, followed by a program of the nonvolatile elements. The program operation copies the SRAM data into nonvolatile memory. Once a *STORE* cycle is initiated, further input and output are disabled until the cycle is completed.

Because a sequence of READs from specific addresses is used for *STORE* initiation, it is important that no other READ or WRITE accesses intervene in the sequence or the sequence will be aborted and no *STORE* or *RECALL* will take place.

To initiate the software *STORE* cycle, the following READ sequence must be performed:

1.	Read address	0000 (hex)	Valid READ
2.	Read address	1555 (hex)	Valid READ
3.	Read address	0AAA (hex)	Valid READ
4.	Read address	1FFF (hex)	Valid READ
5.	Read address	10F0 (hex)	Valid READ
6.	Read address	0F0F (hex)	Initiate *STORE* cycle

The software sequence must be clocked with $\overline{E}$ controlled READs.

Once the sixth address in the sequence has been entered, the *STORE* cycle will commence and the chip will be disabled. It is important that READ cycles and not WRITE cycles be used in the sequence, although it is not necessary that $\overline{G}$ be low for the sequence to be valid. After the t_{STORE} cycle time has been fulfilled, the SRAM will again be activated for READ and WRITE operation.

SOFTWARE NONVOLATILE *RECALL*

A software *RECALL* cycle is initiated with a sequence of READ operations in a manner similar to the software *STORE* initiation. To initiate the *RECALL* cycle, the following sequence of READ operations must be performed:

1.	Read address	0000 (hex)	Valid READ
2.	Read address	1555 (hex)	Valid READ
3.	Read address	0AAA (hex)	Valid READ
4.	Read address	1FFF (hex)	Valid READ
5.	Read address	10F0 (hex)	Valid READ
6.	Read address	0F0E (hex)	Initiate *RECALL* cycle

Internally, *RECALL* is a two-step procedure. First, the SRAM data is cleared, and second, the nonvolatile information is transferred into the SRAM cells. After the t_{RECALL} cycle time the SRAM will once again be ready for READ and WRITE operations. The *RECALL* operation in no way alters the data in the Nonvolatile Elements. The nonvolatile data can be recalled an unlimited number of times.

POWER-UP *RECALL*

During power up, or after any low-power condition ($V_{CC} < V_{RESET}$), an internal *RECALL* request will be latched. When V_{CC} once again exceeds the sense voltage of V_{SWITCH}, a *RECALL* cycle will automatically be initiated and will take $t_{RESTORE}$ to complete.

If the STK11C68 is in a WRITE state at the end of power-up *RECALL*, the SRAM data will be corrupted. To help avoid this situation, a 10K Ohm resistor should be connected either between $\overline{W}$ and system V_{CC} or between $\overline{E}$ and system V_{CC}.

HARDWARE PROTECT

The STK11C68 offers hardware protection against inadvertent *STORE* operation during low-voltage conditions. When $V_{CC} < V_{SWITCH}$, software *STORE* operations are inhibited.

LOW AVERAGE ACTIVE POWER

The STK11C68 draws significantly less current when it is cycled at times longer than 50ns. Figure 2 shows the relationship between I_{CC} and READ cycle time. Worst-case current consumption is shown for both CMOS and TTL input levels (commercial temperature range, $V_{CC} = 5.5V$, 100% duty cycle on chip enable). Figure 3 shows the same relationship for WRITE cycles. If the chip enable duty cycle is less than 100%, only standby current is drawn when the chip is disabled. The overall average current drawn by the STK11C68 depends on the following items: 1) CMOS vs. TTL input levels; 2) the duty cycle of chip enable; 3) the overall cycle rate for accesses; 4) the ratio of READs to WRITEs; 5) the operating temperature; 6) the V_{CC} level; and 7) I/O loading.
