DRAM

MT4C1M16E5
MT4LC1M16E5

FEATURES

- JEDEC- and industry-standard x16 timing, functions, pinouts and packages
- High-performance CMOS silicon-gate process
- Single power supply (+3.3V ±0.3V or 5V ±10%)
- All inputs, outputs and clocks are TTL-compatible
- Refresh modes: RAS#-ONLY, CAS#-BEFORE-RAS# (CBR), HIDDEN; optional Self Refresh
- BYTE WRITE access cycles
- 1,024-cycle refresh (10 row, 10 column addresses)
- Extended Data-Out (EDO) PAGE MODE access cycle
- 5V-tolerant inputs and I/Os on 3.3V devices

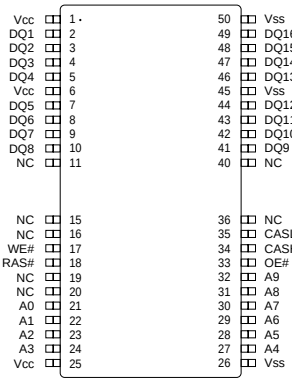
OPTIONS — MARKING

- Voltages
  - 3.3V — LC
  - 5V — C
- Packages
  - Plastic SOJ (400 mil) — DJ
  - Plastic TSOP (400 mil) — TG
- Timing
  - 50ns access — -5
  - 60ns access — -6
  - 70ns access (3.3V only) — -7
- Refresh Rates
  - Standard Refresh (16ms period) — None
  - Self Refresh and (128ms period) — S
- Part Number Example: MT4LC1M16E5TG-6

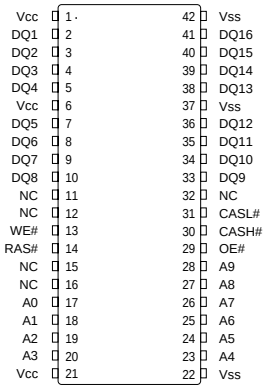
Note: The 1 Meg x 16 EDO DRAM base number differentiates the offerings in one place - MT4LC1M16E5. *The third field distinguishes the low voltage offering: LC designates V_{CC} = 3.3V and C designates V_{CC} = 5V.*

PIN ASSIGNMENT (Top View)

44/50-Pin TSOP (DB-6)



42-Pin SOJ (DA-7)



Note: The "#" symbol indicates signal is active LOW.

1 MEG x 16 EDO DRAM PART NUMBERS

*3.3V version only.

GENERAL DESCRIPTION

The 1 Meg x 16 is a randomly accessed, solid-state memory containing 16,777,216 bits organized in a x16 configuration. The 1 Meg x 16 has both BYTE WRITE and WORD WRITE access cycles via two CAS# pins (CASL# and CASH#). These function like a single CAS# found on other DRAMs in that either CASL# or CASH# will generate an internal CAS#.

The CAS# function and timing are determined by the first CAS# (CASL# or CASH#) to transition LOW and the last CAS# to transition back HIGH. Using only one of the two signals results in a BYTE WRITE cycle. CASL# transitioning LOW selects an access cycle for the lower byte (DQ1-DQ8), and CASH# transitioning LOW selects an access cycle for the upper byte (DQ9-DQ16).

Each bit is uniquely addressed through the 20 address bits during READ or WRITE cycles. These are entered 10 bits (A0-A9) at a time. RAS# is used to latch the first 10 bits

GENERAL DESCRIPTION (continued)

and CAS#, the latter 10 bits. The CAS# function also determines whether the cycle will be a refresh cycle (RAS# ONLY) or an active cycle (READ, WRITE or READ-WRITE) once RAS# goes LOW.

The CASL# and CASH# inputs internally generate a CAS# signal that functions like the single CAS# input on other DRAMs. The key difference is each CAS# input (CASL# and CASH#) controls its corresponding eight DQ inputs during WRITE accesses. CASL# controls DQ1-DQ8, and CASH# controls DQ9-DQ16. The two CAS# controls give the 1 Meg x 16 both BYTE READ and BYTE WRITE cycle capabilities.

A logic HIGH on WE# dictates READ mode, while a logic LOW on WE# dictates WRITE mode. During a WRITE cycle, data-in (D) is latched by the falling edge of WE or CAS# (CASL# or CASH#), whichever occurs last. An EARLY WRITE occurs when WE is taken LOW prior to either CAS# falling. A LATE WRITE or READ-MODIFY-WRITE occurs when WE falls after CAS# (CASL# or CASH#) was taken LOW. During EARLY WRITE cycles, the data outputs (Q) will remain High-Z, regardless of the state of OE#. During LATE WRITE or READ-MODIFY-WRITE cycles, OE# must be taken HIGH to disable the data outputs prior to applying input data. If a LATE WRITE or READ-MODIFY-WRITE is attempted while keeping OE# LOW, no write will occur, and the data outputs will drive read data from the accessed location.

The 16 data inputs and 16 data outputs are routed through 16 pins using common I/O. Pin direction is controlled by OE# and WE#.

PAGE ACCESS

PAGE operations allow faster data operations (READ, WRITE or READ-MODIFY-WRITE) within a row address-defined page boundary. The PAGE cycle is always initiated with a row address strobed-in by RAS#, followed by a column address strobed-in by CAS#. CAS# may be toggled-in by holding RAS# LOW and strobing-in different column addresses, thus executing faster memory cycles. Returning RAS# HIGH terminates the PAGE MODE of operation.

EDO PAGE MODE

The 1 Meg x 16 provides EDO PAGE MODE, which is an accelerated FAST PAGE MODE cycle. The primary advantage of EDO is the availability of data-out even after CAS# returns HIGH. EDO provides for CAS# precharge time (^tCP) to occur without the output data going invalid. This elimination of CAS# output control provides for pipeline READs.

FAST PAGE MODE DRAMs have traditionally turned the output buffers off (High-Z) with the rising edge of CAS#. EDO PAGE MODE DRAMs operate like FAST

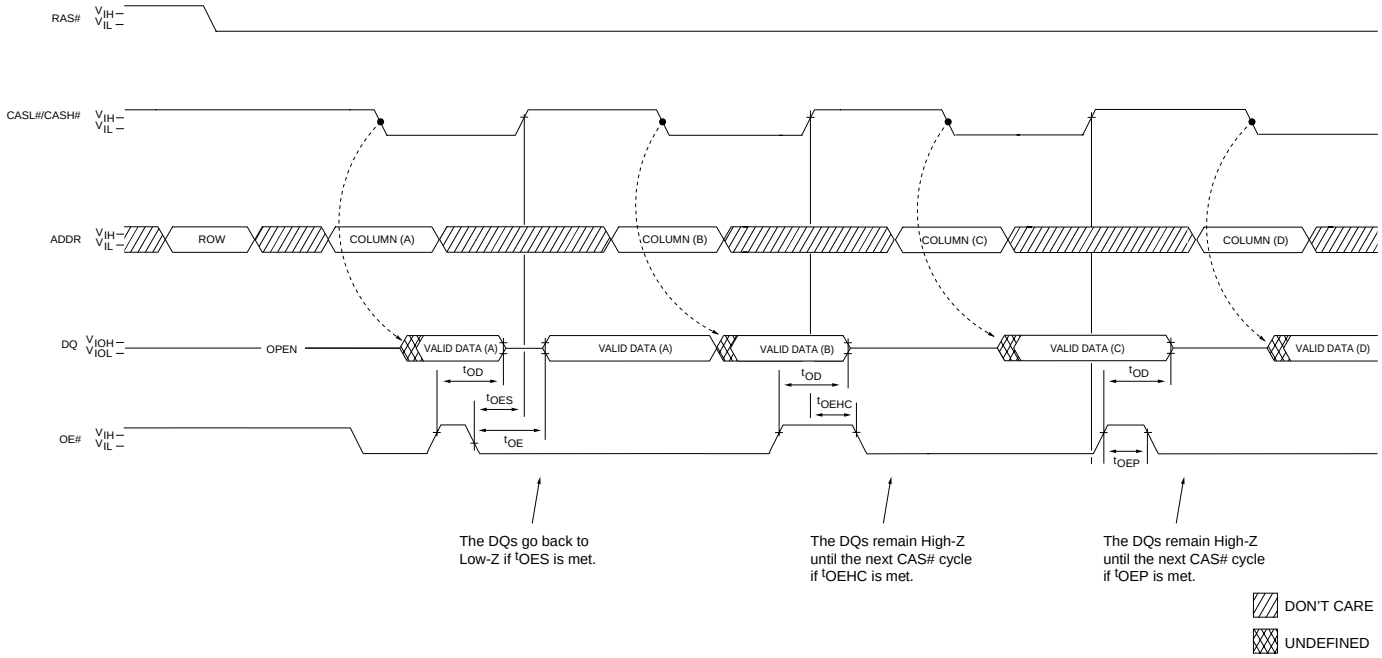

Figure 1
OE# CONTROL OF DQs

EDO PAGE MODE (continued)

PAGE MODE DRAMs, except data will remain valid or become valid after CAS# goes HIGH during READs, provided RAS# and OE# are held LOW. If OE# is pulsed while RAS# and CAS# are LOW, data will toggle from valid data to High-Z and back to the same valid data. If OE# is toggled or pulsed after CAS# goes HIGH while RAS# remains LOW, data will transition to and remain High-Z (refer to Figure 1). WE# can also perform the function of disabling the output drivers under certain conditions, as shown in Figure 2.

During an application, if the DQ outputs are wire OR'd, OE# must be used to disable idle banks of DRAMs. Alternatively, pulsing WE# to the idle banks during CAS# HIGH time will also High-Z the outputs. Independent of OE# control, the outputs will disable after ^{t}OFF, which is referenced from the rising edge of RAS# or CAS#, whichever occurs last.

BYTE ACCESS CYCLE

The BYTE WRITEs and BYTE READs are determined by the use of CASL# and CASH#. Enabling CASL# selects a lower BYTE access (DQ1-DQ8). Enabling CASH# selects an upper BYTE access (DQ9-DQ16). Enabling both CASL# and CASH# selects a WORD WRITE cycle.

The 1 Meg x 16 may be viewed as two 1 Meg x 8 DRAMs that have common input controls, with the exception of the CAS# inputs. Figure 3 illustrates the BYTE WRITE and WORD WRITE cycles.

Additionally, both bytes must always be of the same mode of operation if both bytes are active. A CAS# precharge must be satisfied prior to changing modes of operation between the upper and lower bytes. For example, an EARLY WRITE on one byte and a LATE WRITE on the other byte are not allowed during the same cycle. However, an EARLY WRITE on one byte and a LATE WRITE on the other byte, after a CAS# precharge has been satisfied, are permissible.

REFRESH

Preserve correct memory cell data by maintaining power and executing any RAS# cycle (READ, WRITE) or RAS# refresh cycle (RAS#-ONLY, CBR or HIDDEN) so that all 1,024 combinations of RAS# addresses are executed within ^{t}REF (MAX), regardless of sequence. The CBR, Extended and Self Refresh cycles will invoke the internal refresh counter for automatic RAS# addressing.

The optional Self Refresh mode is available on the MT4LC1M16E5 S. The "S" option allows the user a dynamic refresh, data retention mode at the extended refresh period

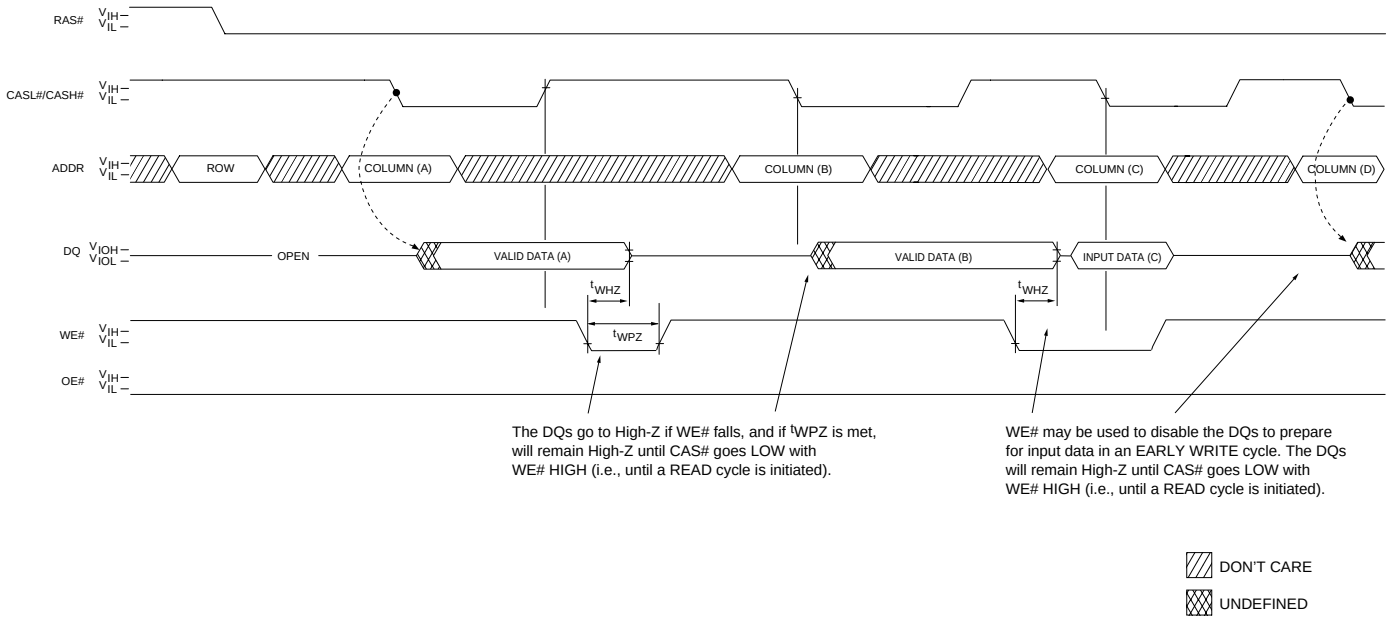

Figure 2
WE# CONTROL OF DQs

REFRESH (continued)

of 128ms, i.e., 125µs per row when using distributed CBR refreshes. The "S" option also allows the user the choice of a fully static, low-power data retention mode. The optional Self Refresh feature is initiated by performing a CBR Refresh cycle and holding RAS# LOW for the specified ^{t}RASS.

The Self Refresh mode is terminated by driving RAS# HIGH for a minimum time of ^{t}RPS. This delay allows for the completion of any internal refresh cycles that may be in process at the time of the RAS# LOW-to-HIGH transition. If the DRAM controller uses a distributed refresh sequence, a burst refresh is not required upon exiting Self Refresh. However, if the DRAM controller utilizes a RAS#-ONLY or burst refresh sequence, all 1,024 rows must be refreshed within the average internal refresh rate, prior to the resumption of normal operation.

STANDBY

Returning RAS# and CAS# HIGH terminates a memory cycle and decreases chip current to a reduced standby level. The chip is preconditioned for the next cycle during the RAS# HIGH time.

	WRITE	L→H→L	L	L	L	X	ROW	COL	Data-In	1, 3
RAS#-ONLY REFRESH		L	H	H	X	X	ROW	n/a	High-Z	
CBR REFRESH		H→L	L	L	H	X	X	X	High-Z	4
SELF REFRESH		H→L	L	L	H	X	X	X	High-Z	4

NOTE: 1. These WRITE cycles may also be BYTE WRITE cycles (either CASL# or CASH# active).
2. These READ cycles may also be BYTE READ cycles (either CASL# or CASH# active).
3. EARLY WRITE only.
4. Only one CAS# must be active (CASL# or CASH#).

ABSOLUTE MAXIMUM RATINGS*

Voltage on V_{CC} Pin Relative to V_{SS}:
- 3.3V ..... -1V to +4.6V
- 5V ..... -1V to +7V

Voltage on NC, Inputs or I/O Pins Relative to V_{SS}:
- 3.3V ..... -1V to +5.5V
- 5V ..... -1V to +7V

Operating Temperature, T_A (ambient) ..... 0°C to +70°C
Storage Temperature (plastic)..... -55°C to +150°C
Power Dissipation 1W
Short Circuit Output Current 50mA

*Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

NOTES

1. All voltages referenced to V_{SS}.
2. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range ($0^{\circ}C \le T_A \le 70^{\circ}C$) is ensured.
3. An initial pause of 100µs is required after power-up, followed by eight RAS# refresh cycles (RAS#-ONLY or CBR with WE# HIGH), before proper device operation is ensured. The eight RAS# cycle wake-ups should be repeated any time the ^{t}REF refresh requirement is exceeded.
4. NC pins are assumed to be left floating and are not tested for leakage.
5. I_{CC} is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time and the outputs open.
6. Column address changed once each cycle.
7. Enables on-chip refresh and address counters.
8. This parameter is sampled. V_{CC} = +3V; f = 1 MHz.
9. AC characteristics assume ^{t}T = 2.5ns.
10. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}).
11. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
12. Measured with a load equivalent to two TTL gates and 100pF; and V_{OL} = 0.8V and V_{OH} = 2V.
13. ^{t}WCS, ^{t}RWD, ^{t}AWD and ^{t}CWD are not restrictive operating parameters. ^{t}WCS applies to EARLY WRITE cycles. ^{t}RWD, ^{t}AWD and ^{t}CWD apply to READ-MODIFY-WRITE cycles. If ^{t}WCS ≥ ^{t}WCS (MIN), the cycle is an EARLY WRITE cycle and the data output will remain an open circuit throughout the entire cycle. If ^{t}WCS < ^{t}WCS (MIN) and ^{t}RWD ≥ ^{t}RWD (MIN), ^{t}AWD ≥ ^{t}AWD (MIN) and ^{t}CWD ≥ ^{t}CWD (MIN), the cycle is a READ-MODIFY-WRITE and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of data-out is indeterminate. OE# held HIGH and WE# taken LOW after CAS# goes LOW results in a LATE WRITE (OE#-controlled) cycle. ^{t}WCS, ^{t}RWD, ^{t}CWD and ^{t}AWD are not applicable in a LATE WRITE cycle.
14. Assumes that ^{t}RCD ≥ ^{t}RCD (MAX).
15. If CAS# is LOW at the falling edge of RAS#, Q will be maintained from the previous cycle. To initiate a new cycle and clear the data-out buffer, CAS# must be pulsed HIGH for ^{t}CP.
16. These parameters are referenced to CAS# leading edge in EARLY WRITE cycles and WE# leading edge in LATE WRITE or READ-MODIFY-WRITE cycles.
17. If OE# is tied permanently LOW, LATE WRITE or READ-MODIFY-WRITE operations are not permissible and should not be attempted. Additionally, WE# must be pulsed during CAS# HIGH time in order to place I/O buffers in High-Z.
18. LATE WRITE and READ-MODIFY-WRITE cycles must have both ^{t}OD and ^{t}OEH met (OE# HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. The DQs will provide the previously read data if CAS# remains LOW and OE# is taken back LOW after ^{t}OEH is met. If CAS# goes HIGH prior to OE# going back LOW, the DQs will remain open.
19. Assumes that ^{t}RCD < ^{t}RCD (MAX). If ^{t}RCD is greater than the maximum recommended value shown in this table, ^{t}RAC will increase by the amount that ^{t}RCD exceeds the value shown.
20. ^{t}OFF (MAX) defines the time at which the output achieves the open circuit condition and is not referenced to V_{OH} or V_{OL}. It is referenced from the rising edge of RAS# or CAS#, whichever occurs last.
21. The ^{t}RAD (MAX) limit is no longer specified. ^{t}RAD (MAX) was specified as a reference point only. If ^{t}RAD was greater than the specified ^{t}RAD (MAX) limit, then access time was controlled exclusively by ^{t}AA (^{t}RAC and ^{t}CAC no longer applied). With or without the ^{t}RAD (MAX) limit, ^{t}AA, ^{t}RAC and ^{t}CAC must always be met.
22. The ^{t}RCD (MAX) limit is no longer specified. ^{t}RCD (MAX) was specified as a reference point only. If ^{t}RCD was greater than the specified ^{t}RCD (MAX) limit, then access time was controlled exclusively by ^{t}CAC (^{t}RAC [MIN] no longer applied). With or without the ^{t}RCD limit, ^{t}AA and ^{t}CAC must always be met.
23. Either ^{t}RCH or ^{t}RRH must be satisfied for a READ cycle.
24. The first CAS#x edge to transition LOW.
25. Output parameter (DQx) is referenced to corresponding CAS# input; DQ1-DQ8 by CASL# and DQ9-DQ16 by CASH#.
26. Each CAS#x must meet minimum pulse width.
27. The last CAS#x edge to transition HIGH.
28. Last falling CAS#x edge to first rising CAS#x edge.
29. Last rising CAS#x edge to first falling CAS#x edge.
30. Last rising CAS#x edge to next cycle's last rising CAS#x edge.
31. Last CAS#x to go LOW.
32. A HIDDEN REFRESH may also be performed after a WRITE cycle. In this case, WE# is LOW and OE# is HIGH.

READ CYCLE
