- UBT™ (Universal Bus Transceiver)
   Combines D-Type Latches and D-Type
   Flip-Flops for Operation in Transparent,
   Latched, or Clocked Mode
- ESD Protection Exceeds 2000 V Per MIL-STD-883, Method 3015
- Latch-Up Performance Exceeds 500 mA Per JEDEC Standard JESD-17
- Typical V<sub>OLP</sub> (Output Ground Bounce)
   < 0.8 V at V<sub>CC</sub> = 5 V, T<sub>A</sub> = 25°C
- High-Impedance State During Power Up and Power Down
- Flow-Through Architecture Optimizes PCB Layout
- Package Options Include Plastic 300-mil Shrink Small-Outline (DL) and Thin Shrink Small-Outline (DGG) Packages and 380-mil Fine-Pitch Ceramic Flat (WD) Package Using 25-mil Center-to-Center Spacings

### description

These 18-bit universal bus transceivers combine D-type latches and D-type flip-flops to allow data flow in transparent, latched, and clocked modes.

Data flow in each direction is controlled by output-enable (OEAB and OEBA), latch-enable (LEAB and LEBA), and clock (CLKAB and CLKBA) inputs. For A-to-B data flow, the device operates in the transparent mode when LEAB is high. When LEAB is low, the A data is latched if CLKAB is held at a high or low logic level. If LEAB is low, the A data is stored in the latch/flip-flop on the high-to-low transition of CLKAB. OEAB is active-high. When OEAB is high, the outputs are active. When OEAB is low, the outputs are in the high-impedance state.

A18				31		B18
OEBA				30	1	CLKBA
LEBA	q	28		29	0	GND

Data flow for B to A is similar to that of A to B but uses  $\overline{\text{OEBA}}$ , LEBA, and  $\overline{\text{CLKBA}}$ . The output enables are complementary (OEAB is active high and  $\overline{\text{OEBA}}$  is active low).

Widebus, EPIC-IIB, and UBT are trademarks of Texas Instruments Incorporated.

SCBS057G - DECEMBER 1990 - REVISED MAY 1997

### description (continued)

When  $V_{CC}$  is between 0 and 2.1 V, the device is in the high-impedance state during power up or power down. However, to ensure the high-impedance state above 2.1 V,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pullup resistor and OE should be tied to GND through a pulldown resistor; the minimum value of the resistor is determined by the current-sinking/current-sourcing capability of the driver.

The SN54ABT16500B is characterized for operation over the full military temperature range of  $-55^{\circ}$ C to 125°C. The SN74ABT16500B is characterized for operation from  $-40^{\circ}$ C to  $85^{\circ}$ C.

### logic diagram (positive logic)

To 17 Other Channels

### absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, V <sub>CC</sub>	$\dots$ =0.5 V to 7 V
Input voltage range, V <sub>I</sub> (except I/O ports) (see Note 1)	–0.5 V to 7 V
Voltage range applied to any output in the high or power-off state, VO	. $-0.5$ V to 5.5 V
Current into any output in the low state, IO: SN54ABT16500B	96 mA
SN74ABT16500B	128 mA
Input clamp current, I <sub>IK</sub> (V <sub>I</sub> < 0)	18 mA
Output clamp current, I <sub>OK</sub> (V <sub>O</sub> < 0)	50 mA
Package thermal impedance, θ <sub>JA</sub> (see Note 2): DGG package	81°C/W
DL package	74°C/W
Storage temperature range, T <sub>stq</sub>	-65°C to 150°C

<sup>†</sup> Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

<sup>2.</sup> The package thermal impedance is calculated in accordance with EIA/JEDEC Std JESD51.

Ci	Control inputs	V <sub>I</sub> = 2.5 V or 0.5 V			3						pF	
Cio	A or B ports	V <sub>O</sub> = 2.5 V or 0.5 V	V		9						pF	

<sup>\*</sup> On products compliant to MIL-PRF-38535, this parameter does not apply.

<sup>†</sup> All typical values are at  $V_{CC} = 5 \text{ V}$ .

<sup>‡</sup> Not more than one output should be tested at a time, and the duration of the test should not exceed one second.

<sup>§</sup> This parameter is characterized, but not production tested.

The parameters IOZH and IOZL include the input leakage current.

<sup>#</sup> For VCC between 2.1 V and 4 V, OE should be less than or equal to 0.5 V to ensure a low state.

This is the increase in supply current for each input that is at the specified TTL voltage level rather than VCC or GND.

### PARAMETER MEASUREMENT INFORMATION

NOTES: A. C<sub>I</sub> includes probe and jig capacitance.

- B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- C. All input pulses are supplied by generators having the following characteristics: PRR  $\leq$  10 MHz,  $Z_{O} = 50 \Omega$ ,  $t_{r} \leq$  2.5 ns,  $t_{f} \leq$  2.5 ns,
- D. The outputs are measured one at a time with one transition per measurement.

Figure 1. Load Circuit and Voltage Waveforms
