

**FEATURES**

- Access Times  
– 17/20/25/35/45/55/70 ns
- Single 5V±10% Power Supply
- Easy Memory Expansion using  $\overline{CE}_1$ ,  $CE_2$ , and  $\overline{OE}$  Inputs
- Battery Backup: 2V Data Retention [P4C1024L only]
- Common Data I/O
- Three-State Outputs
- Fully TTL Compatible Inputs and Outputs
- Advanced CMOS Technology
- Automatic Power Down
- Packages
  - 32-Pin 400 or 600 mil Ceramic DIP
  - 32-Pin 300 mil Ceramic SOJ
  - 32-Pin Ceramic LCC (400x820 mil) [2-sided]
  - 32-Pin Ceramic LCC (450x550 mil)
  - 32-Pin Solder Seal Ceramic Flatpack
  - 32-Pin 600 mil Plastic DIP
  - 32-Pin 400 mil Plastic SOJ

**DESCRIPTION**

The P4C1024/L is a 1,048,576-bit high speed CMOS static RAM organized as 128K x 8. The CMOS memory requires no clocks or refreshing, and has equal access and cycle times. Inputs are fully TTL-compatible. The RAM operates from a single 5V±10% tolerance power supply.

Access times of 17 ns to 70 ns are available. CMOS is utilized to reduce power consumption to a low level.

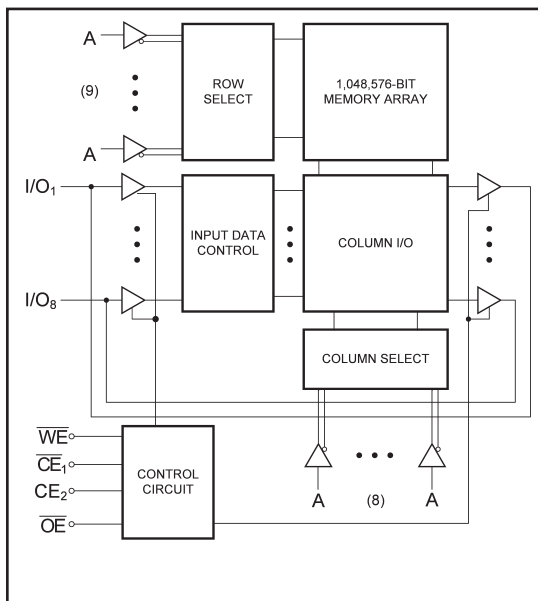

The P4C1024/L device provides asynchronous operation with matching access and cycle times. Memory locations

are specified on address pins  $A_0$  to  $A_{16}$ . Reading is accomplished by device selection ( $\overline{CE}_1$  low and  $CE_2$  high) and output enabling ( $\overline{OE}$ ) while write enable ( $\overline{WE}$ ) remains HIGH. By presenting the address under these conditions, the data in the addressed memory location is presented on the data input/output pins. The input/output pins stay in the HIGH Z state when either  $\overline{CE}_1$  or  $\overline{OE}$  is HIGH or  $\overline{WE}$  or  $CE_2$  is LOW. The low power version offers 2V data retention mode.

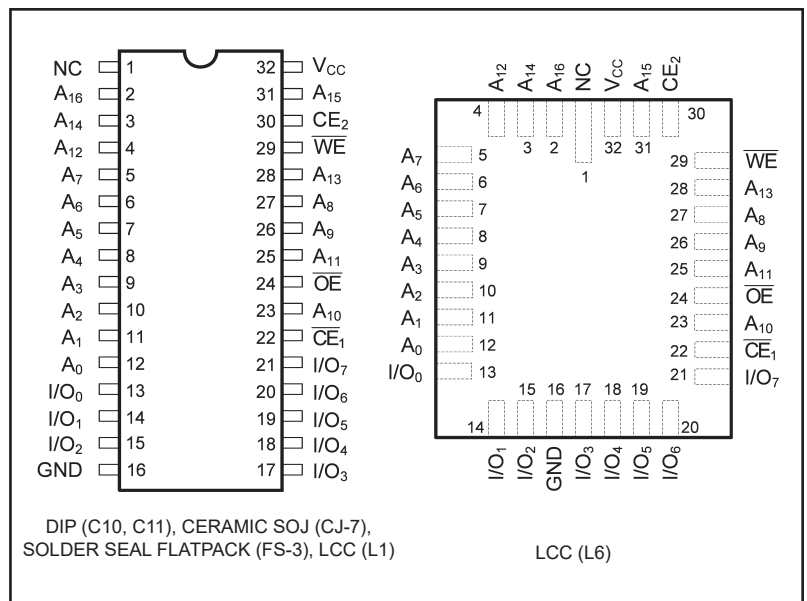

The P4C1024/L is packaged in a 32-pin 400 or 600 mil ceramic DIP and in a 32-pin ceramic SOJ.

#### Notes:

1. Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to MAXIMUM rating conditions for extended periods may affect reliability.
2. Extended temperature operation guaranteed with 400 linear feet per minute of air flow.
3. Transient inputs with  $V_{IL}$  and  $I_{IL}$  not more negative than  $-3.0V$  and  $-100mA$ , respectively, are permissible for pulse widths up to 20ns.
4. This parameter is sampled and not 100% tested.
5.  $\overline{WE}$  is HIGH for READ cycle.
6.  $\overline{CE}_1$  is LOW,  $CE_2$  is HIGH and  $\overline{OE}$  is LOW for READ cycle.
7. ADDRESS must be valid prior to, or coincident with  $\overline{CE}_1$  transition LOW and  $CE_2$  transition HIGH.
8. Transition is measured  $\pm 200$  mV from steady state voltage prior to change, with loading as specified in Figure 1. This parameter is sampled and not 100% tested.
9. Read Cycle Time is measured from the last valid address to the first transitioning address.
10. Transitions caused by a chip enable control have similar delays irrespective of whether  $\overline{CE}_1$  or  $CE_2$  causes them.

### TIMING WAVEFORM OF WRITE CYCLE NO. 1 ( $\overline{WE}$ CONTROLLED)<sup>(11)</sup>

Notes:

- 11.  $\overline{CE}_1$  and  $\overline{WE}$  must be LOW, and  $CE_2$  HIGH for WRITE cycle.
- 12.  $\overline{OE}$  is LOW for this WRITE cycle to show  $t_{WZ}$  and  $t_{OW}$ .
- 13. If  $\overline{CE}_1$  goes HIGH, or  $CE_2$  goes LOW, simultaneously with  $\overline{WE}$  HIGH,

- the output remains in a high impedance state
- 14. Write Cycle Time is measured from the last valid address to the first transitioning address.

Figure 2. Thevenin Equivalent

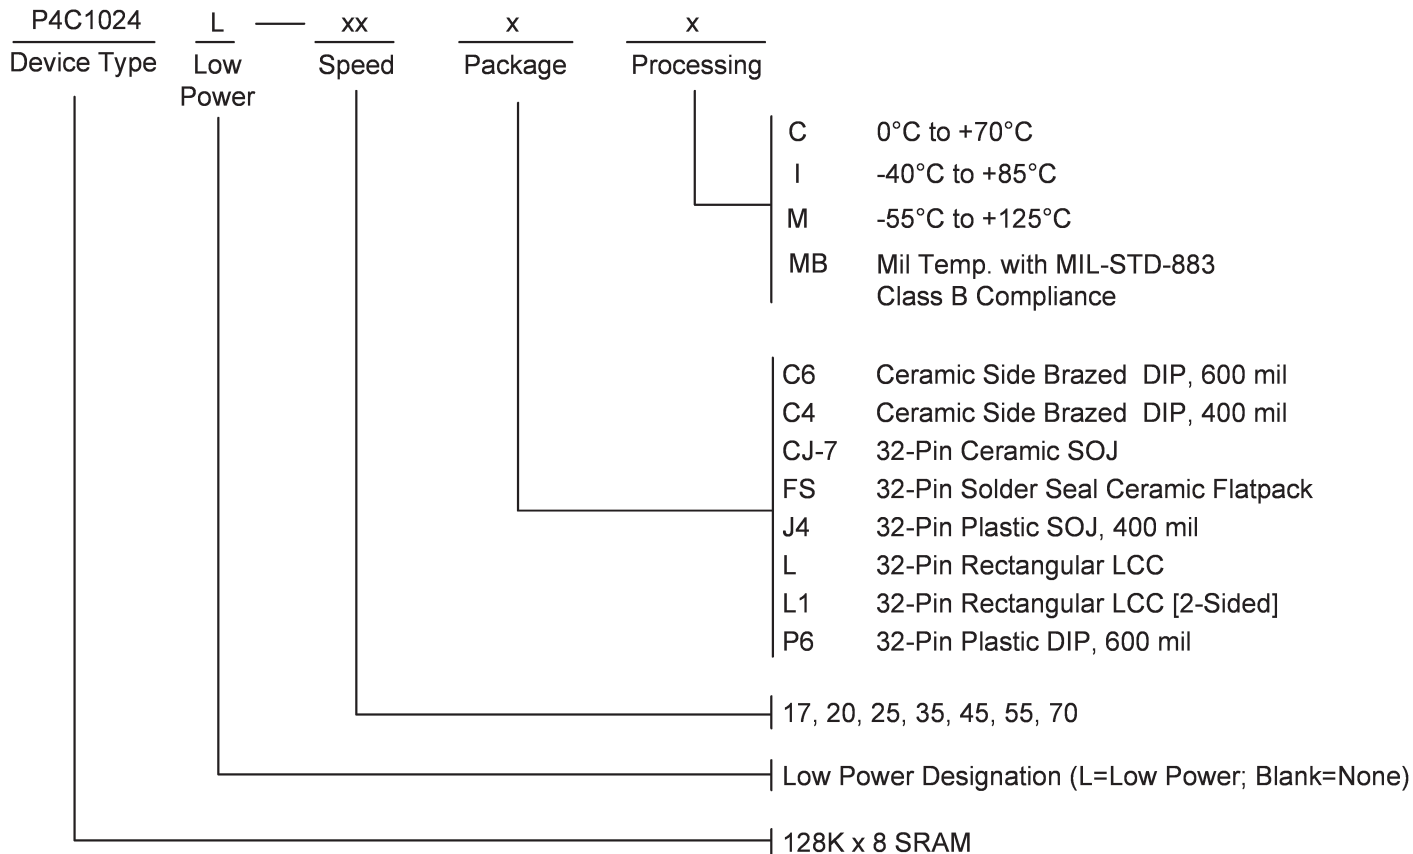

**Note:**

Because of the high speed of the P4C1024, care must be taken when testing this device; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that cause supply bounce must be avoided by bringing the  $V_{CC}$  and ground planes directly up to the contactor fingers. A 0.01  $\mu F$  high frequency capacitor is also required between  $V_{CC}$  and ground.

To avoid signal reflections, proper termination must be used; for example, a 50 $\Omega$  test environment should be terminated into a 50 $\Omega$  load with 1.73V (Thevenin Voltage) at the comparator input, and a 116 $\Omega$  resistor must be used in series with  $D_{OUT}$  to match 166 $\Omega$  (Thevenin Resistance).
