

CD4076BM/CD4076BC TRI-STATE® Quad D Flip-Flop

General Description

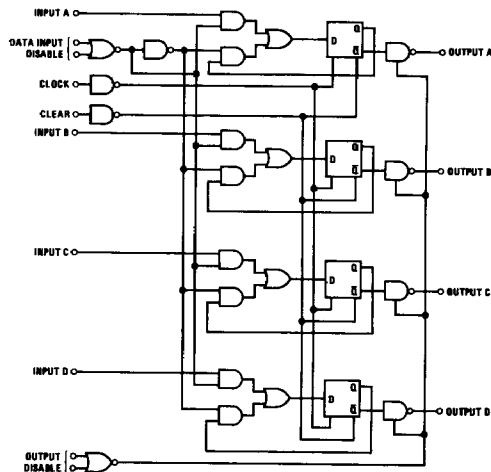

The CD4076BM/CD4076BC TRI-STATE quad D flip-flop is a monolithic complementary MOS (CMOS) integrated circuit constructed with N- and P-channel enhancement mode transistors. The four D type flip-flops operate synchronously from a common clock. The TRI-STATE output allows the device to be used in bus organized systems. The outputs are placed in the TRI-STATE mode when either of the two output disable pins are in the logic "1" level. The input disables allow the flip-flops to remain in their present state without disrupting the clock. If either of the two input disables is taken to a logic "1" level, the Q outputs are fed back to the inputs and in this manner the flip-flops do not change state.

Clearing is enabled by taking the clear input to a logic "1" level. Clocking occurs on the positive-going transition. All inputs are protected against damage due to static discharge by diode clamps to V_{DD} and V_{SS} .

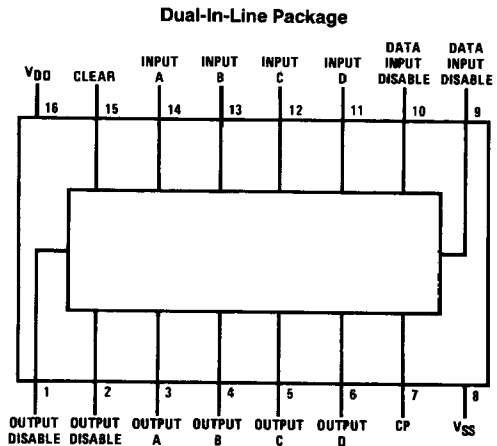

Features

- Wide supply voltage range 3.0V to 15V
- High noise immunity 0.45 V_{DD} (typ.)
- Low power TTL compatibility fan out of 2 driving 74L or 1 driving 74LS
- High impedance TRI-STATE outputs
- Inputs can be disabled without gating the clock
- Equivalent to MM54C173/MM74C173

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed; they are not meant to imply that the devices should be operated at these limits. The table of "Recommended Operating Conditions" and "Electrical Characteristics" provides conditions for actual device operation.

Note 2: $V_{SS} = 0V$ unless otherwise specified.

Note 3: I_{OH} and I_{OL} are tested one output at a time.
