Product Description:

Pericom Semiconductor's PI74FCT series of logic circuits are produced in the Company's advanced 0.8 micron CMOS technology, achieving industry leading speed grades.

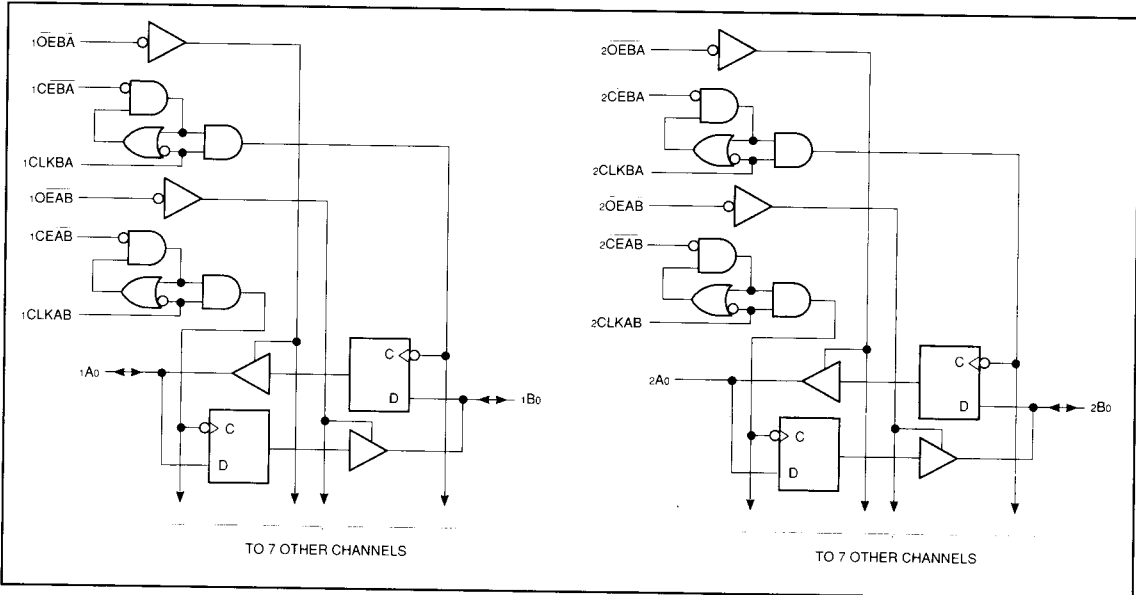

The PI74FCT16952T and PI74FCT162952T are 16-bit registered transceivers organized with two sets of eight D-type latches with separate input and output controls for each set. For data flow from A to B, for example, the A-to-B Enable ($x\text{CEAB}$) input must be LOW in order to enter data from $x\text{Ax}$. The data present on the A port will be clocked on the B register when $x\text{CLKAB}$ toggles from LOW-to-HIGH. The $x\text{OEAB}$ control performs the output enable function on the B port. Control of data from B to A is similar, but uses the $x\text{CEBA}$, $x\text{CLKBA}$, and $x\text{OEBA}$ inputs. By connecting the control pins of the two independent transceivers together, a full 16-bit operation can be achieved. The output buffers are designed with a Power-Off disable allowing "live insertion" of boards when used as backplane drivers.

The PI74FCT16952T output buffers are designed with a Power-Off disable allowing "live insertion" of boards when used as backplane drivers.

The PI74FCT162952T has $\pm 24\text{ mA}$ balanced output drivers. It is designed with current limiting resistors at its outputs to control the output edge rate resulting in lower ground bounce and undershoot. This eliminates the need for external terminating resistors for most interface applications.

Both products are available in 56-pin 240 mil wide plastic TSSOP and 300 mil wide plastic SSOP packages.
