

54LS114

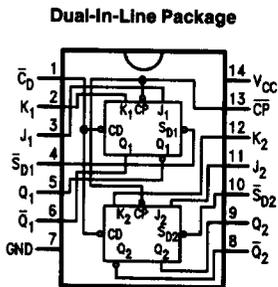

Dual JK Negative Edge-Triggered Flip-Flop with Common Clocks and Clears

General Description

The 'LS114 features individual J, K and set inputs and common clock and common clear inputs. When the clock goes HIGH the inputs are enabled and data will be accepted. The logic level of the J and K inputs may be allowed to change

when the Clock Pulse is HIGH and the bistable will perform according to the truth table as long as the minimum setup times are observed. Input data is transferred to the outputs on the negative-going edge of the clock pulse.

Pin Names	Description
J1, J2, K1, K2	Data Inputs
CP	Clock Pulse Input (Active Falling Edge)
CD	Direct Clear Input (Active LOW)
SD1, SD2	Direct Set Inputs (Active LOW)
Q1, Q2, Q1-bar, Q2-bar	Outputs

Absolute Maximum Ratings (Note)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage	7V
Input Voltage	7V
Operating Free Air Temperature Range	
54LS	-55°C to +125°C
Storage Temperature Range	-65°C to +150°C

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Truth Table

Inputs		Output
@ t_n		@ t_{n+1}
J	K	Q
L	L	Q_n
L	H	L
H	L	H
H	H	$\overline{Q_n}$

Asynchronous Inputs:

LOW input to \overline{SD} sets Q to HIGH levelLOW input to \overline{CD} sets Q to LOW level

Clear and Set are independent of clock

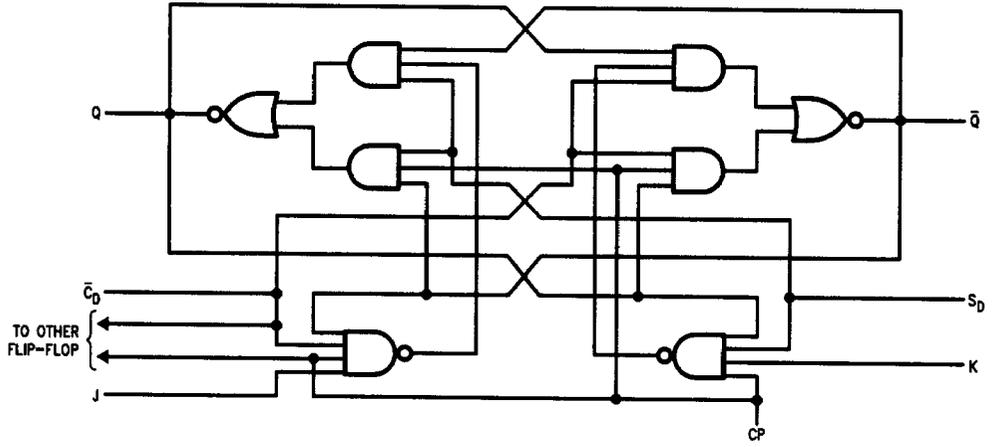

Simultaneous LOW on \overline{CD} and \overline{SD} makes both Q and \overline{Q} HIGH

H = HIGH Voltage Level

L = LOW Voltage Level

 t_n = Bit time before clock pulse. t_{n+1} = Bit time after clock pulse.
