

128Kx8 Static RAM CMOS, Monolithic

PRELIMINARY

The EDI88128C/LP/P* is a high performance, megabit density monolithic Static RAM organized as 128Kx8 bits, designed for use in systems where fast computation, low power, and board density are the main requirements. The military product has two low power versions, P and LP. The LP version offers a data retention function for battery back-up applications.

The EDI88128C/LP/P has eight bi-directional input-output lines to provide simultaneous access to all bits in a word. An automatic power down feature permits the on-chip circuitry to enter a very low standby power mode and be brought back into operation at a speed equal to the address access time.

Military product compliant to MIL-STD-883, Paragraph 1.2.1 is available.

* Note: EDI88130C/LP/P is identical to the EDI88128C/LP/P, with an additional chip select line (S) which provides system memory security during power down in non battery backed up systems and memory banking in high speed battery backed systems where large multiple pages of memory are required. EDI88128C/LP/P and EDI88130C/LP/P are direct pin for pin replacements for EDI modules EDI8M8128C/LP/P and EDI8M8130C/LP/P, respectively.
