

NDS9400A

Single P-Channel Enhancement Mode Field Effect Transistor

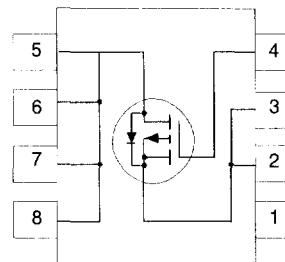

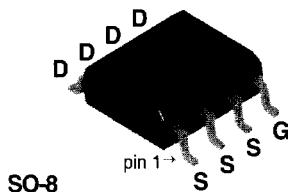

2

General Description

These P-Channel enhancement mode power field effect transistors are produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is especially tailored to minimize on-state resistance, provide superior switching performance, and withstand high energy pulses in the avalanche and commutation modes. These devices are particularly suited for low voltage applications such as notebook computer power management and other battery powered circuits where fast switching, low in-line power loss, and resistance to transients are needed.

Features

- -3.4A, -30V. $R_{DS(ON)} = 0.13\Omega$ @ $V_{GS} = -10V$.
- High density cell design for extremely low $R_{DS(ON)}$.
- High power and current handling capability in a widely used surface mount package.
- Rugged and reliable.

Absolute Maximum Ratings

$T_A = 25^\circ C$ unless otherwise noted

Notes:

1. R_{JC} is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. R_{JC} is guaranteed by design while R_{JC} is determined by the user's board design.

$$P_D(t) = \frac{T_J - T_A}{R_{JC}(t)} = \frac{T_J - T_A}{R_{JC} + R_{SCA}(t)} = I_D^2(t) \times R_{DS(on)}(t)$$

Typical R_{SCA} using the board layouts shown below on 4.5" x 5" FR-4 PCB in a still air environment:

Scale 1 : 1 on letter size paper

2. Pulse Test: Pulse Width $\leq 300\mu\text{s}$, Duty Cycle $\leq 2.0\%$.
