Description

The AT27LV020 chip is a low power, low voltage 2,097,152 bit ultraviolet erasable and electrically programmable read only memory (EPROM) organized as 256K x 8 bits. It requires only one supply in the range of 3.0 to 5.5 V in normal read mode operation, making it ideal for portable systems.

With a typical power draw of only 10 mW at 1 MHz and V_{CC} at 3.3 V, the AT27LV020 draws less than one-fifth the power of a standard 5-V EPROM. Standby mode supply current is typically less than 1 µA at 3.3 V.

Description (Continued)

The AT27LV020 comes in a choice of industry standard JEDEC-approved packages, including: one-time programmable (OTP) plastic PDIP, PLCC, and TSOP, as well as windowed ceramic Cerdip and LCC. All devices feature two-line control ($\overline{CE}$, $\overline{OE}$) to give designers the flexibility to prevent bus contention.

The AT27LV020 operating with V_{CC} at 3.0 V produces TTL level outputs that are compatible with standard TTL logic devices operating at V_{CC} = 5.0 V.

Atmel's 27LV020 has additional features to ensure high quality and efficient production use. The Rapid Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 µs/byte. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages. The AT27LV020 programs identically as an AT27C020.

Erasure Characteristics

The entire memory array of the AT27LV020 is erased (all outputs read as V_{OH}) after exposure to ultraviolet light at a wavelength of 2537 Å. Complete erasure is assured after a minimum of 20 minutes exposure using 12,000 µW/cm^2 intensity lamps spaced one inch away from the chip. Minimum erase time for lamps at other intensity ratings can be calculated from the minimum integrated erasure dose of 15 W•sec/cm^2. To prevent unintentional erasure, an opaque label is recommended to cover the clear window on any UV erasable EPROM which will be subjected to continuous fluorescent indoor lighting or sunlight.

Atmel's 27LV020 Integrated Product Identification Code[1]

Manufacturer	0	0	0	0	1	1	1	1	0	1E
Device Type	1	1	0	0	0	0	1	1	0	86

Note: 1. The AT27LV020 has the same Product Identification Code as the AT27C020. Both are programming compatible.

Rapid Programming Algorithm

A 100 µs $\overline{PGM}$ pulse width is used to program. The address is set to the first location. V_{CC} is raised to 6.5 V and V_{PP} is raised to 13.0 V. Each address is first programmed with one 100 µs $\overline{PGM}$ pulse without verification. Then a verification/ reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive 100 µs pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the next address is selected until all have been checked. V_{PP} is then lowered to 5.0 V and V_{CC} to 5.0 V. All bytes are read again and compared with the original data to determine if the device passes or fails.
