PLL Clock Multiplier, 14 MHz - 200 MHz, 3.3 V / 5.0 V

ON Semiconductor®

www.onsemi.com

Description

The NB3N511 is a clock multiplier that will generate one of nine selectable output multiples of an input frequency via two 3-level select inputs (S0, S1). It accepts a standard fundamental mode crystal or an external reference clock signal. Phase-Locked-Loop (PLL) design techniques are used to produce a low jitter, TTL level clock output up to 200 MHz with a 50% duty cycle. An Output Enable (OE) pin is provided, and when asserted low, the clock output goes into tri-state (high impedance). The NB3N511 is commonly used in electronic systems as a cost efficient replacement for crystal oscillators

Features

- Clock Output Frequencies up to 200 MHz
- Nine Selectable Multipliers of the Input Frequency
- Operating Range: $V_{DD} = 3.3\text{ V} \pm 10\%$ or $5.0\text{ V} \pm 5\%$
- Low Jitter Output of 25 ps One Sigma (rms)
- Zero ppm Clock Multiplication Error
- 45% - 55% Output Duty Cycle
- TTL/CMOS Output with 25 mA TTL Level Drive
- Crystal Reference Input Range of 5 - 32 MHz
- Input Clock Frequency Range of 1 - 50 MHz
- OE, Output Enable with Tri-State Output
- 8-Pin SOIC
- Industrial Temperature Range -40°C to $+85^{\circ}\text{C}$
- These are Pb-Free Devices

3. The crystal should be fundamental mode, parallel resonant. Do not use third overtone. For exact tuning when using a crystal, capacitors should be connected from pins X1/CLK to GND and X2 to GND. The value of these capacitors is given by the following equation, where C_L is the specified crystal load capacitance: Crystal capacitance (pF) = $(C_L - 12) \times 2$. So, for a crystal with 16 pF load capacitance, use two 8 pF capacitors.

APPLICATIONS INFORMATION

High Frequency CMOS/TTL Oscillators

The NB3N511, along with a low frequency fundamental mode crystal, can build a high frequency TTL output oscillator. For example, a 20 MHz crystal connected to the NB3N511 with the 5X output selected (S1 = L, S0 = H) produces an 100 MHz CMOS/TTL output clock.

Decoupling and External Components

The NB3N511 requires a 0.01 µF decoupling capacitor to be connected between V_{DD} and GND on pins 2 and 3. It must be connected close to the NB3N511 to minimize lead inductance. Control input pins can be connected to device pins V_{DD} or GND, or to the V_{DD} and GND planes on the board.

Series Termination Resistor

A 33 Ω terminating resistor can be used next to the CLK pin for trace lengths over one inch.

Crystal Information

The crystal used should be a fundamental mode (do not use third overtone), parallel resonant. Crystal load capacitors should be connected from pins X1 to ground and X2 to ground to optimize the frequency accuracy, See Figure 1.

The total on chip capacitance is approximately 12 pF. A parallel resonant, fundamental mode crystal should be used. The device crystal connections should include pads for

small capacitors from X1 to ground and from X2 to ground. These capacitors are used to adjust the stray capacitance of the board to match the nominally required crystal load capacitance. Because load capacitance can only be increased in this trimming process, it is important to keep stray capacitance to a minimum by using very short PCB traces (and no vias) between the crystal and device. Crystal capacitors, if needed, must be connected from each of the pins X1 and X2 to ground. The value (in pF) of these crystal caps should equal $(C_L - 12 \text{ pF}) * 2$. In this equation, C_L = crystal load capacitance in pF. Example: For a crystal with a 16 pF load capacitance, each crystal capacitor would be 8 pF $[(16 - 12) * 2 = 8]$.
